### ABSTRACT

This manual presents instruments for evaluating the program and facilities of day care centers and family day care homes serving nonhandicapped children aged 3-5. Chapter 1 discusses child care evaluation in general and outlines the rationale underlying this evaluation system (including the principle that day care evaluation should assess program input rather than output). Subsequent chapters include descriptions of: (1) development, field testing, and revision of both the evaluation forms and the supportive information provided in the manual; and (2). administering evaluation and scoring forms, and summarizing data. An appendix, comprising four fifths of the document, contains all 27 forms used in the evaluation system. These include: (1) identification forms, which summarize information on the facility and clients; (2) objectives forms, which help center and supervising agency staff to establish the standards for evaluation; (3) a form that summarizes the organization and procedures used at the center and identifies the location of supporting documents (which could prove that the services are actually provided as described); (4) staff questionnaires, which provide partial verification of information in the organization and procedures form and also measure staff knowledge and staff morale; (5) checklists of equipment, and physical facilities and their utilization; and (6) forms for observer ratings of group experiences, individual caretakers and routine activities. (CHW)

Documents acquired by ERIC include many informal upublished materials not available from other sources. ERIC makes every effort to obtain the best copy available. Nevertheless, items of marginal reproducibility are often encountered and this affects the of the microfiche and hardcopy reproductions ERIC makes available via the ERIC Document Reproduction Service (EDRS). ERIC is not responsible for the quality of the original document. Reproductions supplied by EDRS are the best that can be made from

### Foreword

This Day Care Evaluation Manual has been developed by the Council's research department over a period of two-and-a-half years through a project in which evaluation concepts and instruments were systematically tested and re-tested. The instruments described in this report meet the need for self-evaluation tools. They can be applied by day care center staff, parent organizations, icensing personnel, researchers, and consultants.

In addition to offering a basis for evaluating program, the manual provides agencies with a means of re-examining program philosophy, objectives, and administration in a comprehensive and systematic manner. Although developed specifically for day care evaluation, many of these instruments could be applied, with a minimum of modification, in other service fields.

The Council is indebted to the 24 centers and homes that participated in the first pilot test of the instruments, and to the 10 agencies which applied the tools themselves in the second test. Several of these agencies found the manual to be useful as a guide to staff training in addition to its value in evaluating program.

Special recognition is due Ms. Helen Howerton, Project Officer, Office of Child Development, U.S. Department of Health, Education and Welfare, for her leadership and guidance throughout this project.

John H. Ballard
Executive Director

## Introduction

The Council for Community Services in Metropolitan Chicago submitted a proposal in May 1972 to the Office of Child Development, U.S. Department of Health, Education, and Welfare to develop measures to evaluate the quality and style of services in a cross section of day care facilities. A grant award was approved July 1, 1972. This Day Care Evaluation Manual is the result of two years of work on the objectives identified in the proposal.

The major objectives to be accomplished were

- 1. To develop and pilot-test measures to assess the quality of day care from emotional, cognitive, and social points of view in a broad range of day care facilities;
- 2. To organize these measures into a system of instruments to be used by licensegrantors, supervising agencies, funding sources, center personnel, and day care researchers; and
- 3. To assure that the evaluation system devised would be self-explanatory and include sufficient direction and guidance for administration by suitable personnel, using only the materials provided by this system.

During the first project year, the staff developed the preliminary instruments and pilottested them, using interviewers and observers whom they trained for these purposes. The first pilot test included fifteen day care centers and nine day care homes. Experience with the pilot test provided plentiful material for the development of the evaluation system.

In the second year of the project, the instruments were revised and reorganized and a second pilot test was conducted. Seven day care programs in the Chicago area plus three additional ones in other states were evaluated. Six experts in early childhood education offered critical reviews of preliminary versions of the *Manual*. The respondents and observers who carried out the second field test were not trained by project staff, but the evaluation instruments were discussed in feedback sessions and revised accordingly. The organizational form of the instruments also served as a comprehensive evaluation device, appropriate for evaluations administered either by the day care facility itself or by an outside body. The feedback from the second field test was incorporated into the final revision, which is

ix

published as this Day Care Evaluation Manual.

Chapter 1 of the Manual discusses child care evaluation in general, the conceptual foundation of the evaluation system, and the rationale employed in incorporating the concepts into this Manual. Chapter 2 describes how the Manual was developed, its two field tests, and the revisions that resulted from these efforts. Chapter 3 describes the primary function of each group of forms in the evaluation system and the manner in which the forms were developed. Chapter 4 describes the administration of the evaluation process as a total organization and suggests methods of selecting portions of the process for the particular needs of the user. Chapter 5 discusses the selection and training of observers. Chapter 6 provides the methodology for scoring the evaluation forms. All forms included in the Manual and directions for their completion appear in the Appendix.

One point on the terminology used in this Manual should be kept in mind by the user. Since center staff and day care mothers and families are evaluated within the same framework and one form is used for both types of facilities wherever possible, a term was needed to apply to any person charged with the care of the children. The term caretaker was adopted for that purpose. It does not imply custodial care — as it might in some other contexts. It is merely a common title for all who take care of the children, whether they are directors, teachers, day care mothers, aides, teen-age helpers, volunteer grandmothers, or consultants.

# **CHAPTER 1**

# Rationale for Evaluation of Day Care Services

ħ

This Manual responds to the need to evaluate day care centers and day care homes in a realistic way. Day care has become the focus of much controversy. Yet despite the varying reactions of funding bodies to demands for day care and despite conflicting opinions regarding its potential benefits, care for children outside their own homes in day care centers and day care homes is expected to increase as the number of employed mothers of young children increases.

The responsibility undertaken in providing care for young children for extended periods of time is a great one. Regardless of good intentions, fine training, and expensive equipment, any facility providing this care should welcome a means to step back, take stock, and consider the quality of the care it is providing.

As in most other spheres of life, day care providers do their work in ways that have become habits for them. Mach of their behavior is dictated by their own personal, established repertoires of responses to children. They seldom are able to think through the suitability of their responses for the particular circumstances and children involved.

In part, this problem is a consequence of the rapid and demanding nature of interaction with a group of children. It is often the effect of a type of professionalism, or nondiscriminant application of stock reactions to model situations. It also reflects the fact that much of what is the essence of the interaction between adults and children was learned by the day care workers during their own childhoods. Such early, basic lessons on the role of adults in the lives of children, whether beneficial or harmful, are difficult to unlearn.

To fulfill the obligation implicit in caring for children, caretakers must be willing to adopt a self-conscious, evaluative attitude. For the sake of the tender lives involved and for the sake of personal growth and professional development, they must be willing to put aside concerns with threats to self-esteem, and honestly evaluate their own behavior.

The commonly voiced attitude toward evaluation that "I do not have time for this paper work and planning, instead I could be using my time in activities that provide services to children" may conceal a logical gap. Without genuine evaluation, there is no assurance

<sup>1</sup> Mary D. Keyserling, Working Mothers and the Need for Child Care Services, U.S. Department of Labor, Women's Bureau, June 1968.

that all these activities are of real value or are even harmless. Objective evaluation is the only means available for reviewing actions and for making improvements in practice.

The gaps in day care evaluation were identified by examining day care systems, typical day care contracts, day care operating manuals, day care training programs, and day care evaluation techniques. Six general orientations that an evaluation system should have emerged from this comprehensive examination of the day care evaluation situation. They were clarified and became more precise as they were used to guide the development of this Manual. These orientations are as follows:

- 1. To address program input rather than program output or impact
- IL To provide for evaluation of a broad range of day care providers, from small day care homes to large centers, and as a corollary to deal with real, existing, non-exemplary facilities
- III. To provide for evaluation of all areas of day care service
- IV. To aim for high degrees of specificity and rigorousness in the evaluation criteria
- V. To maximize feedback and conservation of information
- VI. To be flexible and yet maintain cohesiveness under the various circumstances of the Manual's use

### I. Input Design

The rationale for the first orientation—to address program input rather than program output or impact—is based on a reaction to recent trends in evaluation work. It has recently been quite fashionable to evaluate a program by measuring its impact on its recipients. This approach requires measuring and comparing particular characteristics of children before and after exposure to particular programs (or measuring after the exposure and drawing comparisons with standardized age norms) and then attributing the changes observed to the nature or quality of the programs.

While the typical impact study will probably indicate which of a group of programs is most successful, it will not give any indication as to what aspects of the program account for this success. The typical impact study possesses some of the elegance and attractiveness of a quasi-experimental research design, but it neglects to require that the programs be carefully measured and described. The experimental designs on which the impact studies are based do require careful description of the experimental treatments applied. A significant degree of the power of experimental research derives from this requirement.

The fact that curriculum guides or operating manuals exist for various programs does not weaken this point. They are not descriptions of the treatments applied to children. In practice, such guides are often tucked away in places that are inaccessible to staff, even when highly accessible, their effect on the staff is far from guaranteed. These manuals seldom actually describe or strongly influence the on-line behavior of the caretaker. Although the current trend in evaluation to disregard the study of program input is under-

standable in light of the old-fashioned monitoring systems to which this trend is a reaction—the important step of studying what types of care benefit children the most is neglected in the process.

This Manual developes a method that should be an improvement over the less meaningful versions of input evaluation since it measures the presence of program features that are believed to benefit children.

Authoritative statements and much research are available that imply the benefits of particular child care practices. Teachers are trained and ultimately tested on their understanding of these practices. Curricula and entire programs are based on interpretations of theoretical systems that include these practices. Yet evaluations of the actual practices are conspicuously rare. This Manual allows the evaluator to measure the application of these practices.

By providing a means to measure or more accurately describe the day care environment, the *Manual* also provides to impact researchers a way of precisely measuring treatment variables and thus a method of more closely approximating the experimental model.

### 11. Evaluation of a Broad Range of Day Care Providers

At present, far fewer children are enrolled in day care centers than in day care homes. Both types of care are probably required to meet a variety of needs. It is likely that many parents, regardless of available resources, will continue to choose care outside of organized program systems for a variety of reasons, such as wishing to maintain control over their own day care situation, the location of the facility, and an aversion to governmental or highly organized programs.<sup>2</sup> Authorities agree that only a small percentage of children in day care are in situations that could be described as exemplary. It is highly unlikely that adequate resources will be available in the near future to institute and support the number of high-powered programs that would be required to meet present or projected day care needs at an ideal or exemplary level of service. Economics, logistic feasibility, and user behavior strongly suggest that future day care facilities will resemble those now available, and that the most direct and efficient way to improve child care is to aid in evaluating and improving the types of services now being offered.

The broad orientation used in this Manual makes it applicable to almost any day care facility. (The Manual may be used as a resource guide by various types of facilities. The Manual includes a compendium of possible services, and orientations toward care interpreted into every day behavior. It suggests many possible approaches to conducting various aspects of the day care operation. The evaluation instruments were developed inductively and are comprehensive. By using this Manual, day care personnel are likely to discover practices they would like to try out in their own program.

The broad range of facilities addressed by the Manual brings a number of indirect potential benefits to its users. Because the evaluation forms are comparable, cross-comparisons

Westinghouse Learning Corporation and Westat Research, Inc., Day Care Survey, 1970, Summary Report and Basic Analysis, report prepared for Office of Economic Opportunity, U.S. Department of Health, Education, and Welfare, 1971.

can be made between facilities and between types of facilities—a type of research that should lead to improvements in the services being given by sources both within and external to actual day care organizations.

Another benefit is the ability to precisely compare facilities known to vary in quality or success in order to suggest likely sources of differences in quality.

Still another benefit is the ability to isolate the types of facilities that are likely to provide particular types of service. (For example, size of center tends to affect the components of the programs.) Particular children may need particular types of care, and the types of facilities likely to give these types of care can be identified by analysis of data from evaluations of a range of facilities.

Typical licensing procedures are very specific in their requirements for physical facilities. Yet their requirements for the emotional and cognitive atmosphere provided are stated only in general terms. The judgments required of licensing personnel are therefore rather general and subjective in these areas.

If a specific system of evaluation, such as the one offered here, were integrated into licensing procedures, licensing decisions would be more comparable, and the licensing personnel would have at their command a ready device for formulating and refining their judgments and for making more specific suggestions to the facilities they supervise.

This possibility of making the emotional and cognitive aspects of licensing more objective should not be viewed as a sophisticated and objective means of denying a license to an applicant. It is acknowledged that licensing procedures are meant to ensure minimum acceptable quality. What the Manual does is to examine day care quality where it exists, and by providing a finely graded system of judging the developmental potential of the environment, to provide a manageable, objective means of evaluation. The individual facility may thus be improved through its relationship with its licensing supervisor and by retilizing findings made possible by its membership in a group of identically evaluated facilities.

There are further benefits to having many facilities evaluated by the same system. The following are a few examples:

- The availability of objective, comparable, evaluative data on numerous day care providers would produce a base line for the study of the effectiveness of caretaker training programs. The analysis of data on facilities that receive consistently high ratings could guide staff recruitment activities and contribute to the revision of recruitment standards that were originally established without supporting evidence.
- Levels of accreditation, based on evaluation, could be awarded in addition to a license. Accreditation could serve as an incentive to day care providers. Given proper publicity, it might create a demand on the part of day care users for high accreditation, which would indirectly motivate day care providers to improve their service.
- The broad scope of this Manual and the universality of the licensing requirement make it possible to compare facilities that are very different. There is an important need for this type of comparison. Although certain children fare better in the intimate and personal atmosphere of a day care home than in a day care center,

for example, many parents seek center care without previously considering the day care home alternative. This behavior is probably an effect of the well-publicized importance of early learning and its association with organized preschool programs. Many parents are obviously seeking a head start for their children, but they may not have the information they need to make the right decision. Use of portions of the *Manual* in conjunction with licensing procedures would allow comparison of the quality of service available from very different types of facilities. It would also give a justifiable basis for developing and augmenting types of facilities that either excel in quality of service or provide unusual service of a desirable nature.

If it were found, for example, that day care homes excel in providing an important facet of child care, or that certain types of day care homes provide equivalent program services plus added conveniences for parents, organizations to augment day care home services are likely to emerge. Such organizations could coordinate and provide consulting services, staff pools for take-over in emergencies, referral and matching services, financial and advisory help in meeting standards, and staff training. The Neighborhood Family Day Care Parent Program in Washington, D.C., and the Day Care Neighborhood Service in Portland, Oregon, are examples of comprehensive augmenting programs of this nature.

Research on numerous topics more general than the quality of day care would be possible with the collection of completed evaluations. The data generated by the forms in this *Manual* include the many variables commonly associated with basic psychological and sociological research.

### III. Coverage of All Service Areas

The decision to provide for the evaluation of all service areas grew out of knowledge of the number and types of provisions usually included in day care contracts. If evaluation means compliance with contractual provisions, then there should be a way to measure progress toward meeting these requirements. There are two less obvious advantages to evaluating all service areas. First, considering the nature and large number of provisions contained in day care contracts, it is important to have a means of isolating the types of objectives that usually are not fulfilled in practice so that a plan of action can be contemplated as a remedy. Unfulfilled objectives that are judged peripheral to child care might be dropped in favor of concentrating on those that are more central. The more important, unfulfilled objectives could be given new support, or new delivery systems could be instituted to make them more attainable. And second, to most effectively use an input evaluation as the description of the experimental treatment in an impact study, all services should be examined and made available for analysis. The impact of a program might be the result of a service whose importance would not come to light unless all service factors are examined.

Day care services were classified according to function; this classification was used as a guide to ensure that all services were covered in the evaluation.

### A. Administration

- 1. Budgeting, fiscal management, and cost analysis
- 2. Personnel practices
  - a) Recruitment
  - b) Allocation
  - c) Evaluation
  - d) Advancement
  - e) Grievance resolution
- 3. Regulatory compliance
- 4. Operation of center policy committee
- 5. Maintaining records and clerical functions

### B. Supporting Services

- 1. Client recruitment
- 2. Screening for client problems
- 3. Referral and follow-up for client problems
- 4. Procurement of community resource donations
- 5. Referral and follow-up for family needs identified
- 6. In-service training program and staff development
- 7. Parent contacts

### C. Direct Program

- 1. Curriculum input ,
- 2. Socioemotional input
- 3. Scheduling of activities
- 4. Nutritious and attractive food service

### D. Organizational Structure

### IV. Specificity and Rigor

Logic requires that quantitative comparisons can be drawn only between like entities. If day care facilities are to be compared with one another or with established standards, the particular aspects of the facilities must be described in specific, comparable categories.

The rigorous nature of this evaluation process is a response to the looseness and non-productiveness observed in many day care evaluations. Many precise requirements are included in large-scale day care contracts or operating manuals. Typical evaluation teams are equipped with lists of objectives and indicators of accomplishment. These lists of indicators are by no means complete, more nearly resembling examples and leaving a great deal to the ingenuity and diligence of the evaluators. The actual form of the evidence showing accomplishment of objectives and its location is left in large part to on-site discovery and the good will of facility staff. An evaluation of this type requires a large team of evaluators to spend a great deal of time and yields findings that are uneven in their coverage and validity. The unevenness results from individual differences between the evaluators, the attitudes of center staff, and variations in evaluation-time spent on the site.

In contrast, the procedure recommended by this Manual requires a large investment of time by the staff of the evaluated facility. It standardizes the portions of evaluation time spent in making observations and defining what is to be observed.

oln a typical evaluation, false impressions may be fortered or the day care staff may guide the evaluators to impressions favoring their operation beyond what it deserves. At the same time, many contracts have requirements that are impossible for some facilities to meet. The day care provider may well feel that if he appears to be meeting his contract requirements, his contract is more likely to be renewed and the time during which he can offer the important services that he actually does provide will be extended. This motivation does not necessarily reflect a dishonest intent, and in the short term, the reasoning implied in it is probably sound. Programs are more likely to be continued or refunded if they appear to be performing the services required of them.

Nevertheless, resources are likely to be wasted in the process of trying to give the appearance of contract compliance if gestures of service are provided in lieu of real service. It is not unusual to find a nonfunctional service being counted toward fulfilling a requirement (for example, continued referral of children to an agency that has been found incapable of performing the required services). Nor is it unusual to discover that records have been used to reflect an exaggerated image of the services provided (for example, if the contract requires many volunteers, the names of people only tenuously linked to the facility are listed).

The worst effect of these possibilities is the tendency to perpetuate the situation and its associated inefficiencies and undue pressures on personnel. New contracts are often modeled after existing ones that appear to be effective and workable. The easier it is to give the appearance that impractical objectives have been accomplished, the more likely it is that these objectives will be required of subsequent programs, which will then become embroiled in the same types of problems.

It would be more constructive to renegotiate standards or improve the resources available to the day care providers according to rigorous evaluation findings. The rigor of this Manual is intended to assure a fair evaluation of facilities and to provide firm bases for determining the practicality of what is required of them. The Manual therefore is designed so that any program facet not directly observed by the evaluator can be validated by using information previously provided by day care staff. The information required for validation is provided in a form specific enough to allow an outside agent to use it with a minimum of personal inquiry.

### V. Feedback and Conservation of Information

Information is useful only to the extent that it is preserved in legible form and available to those who can benefit from it. A number of devices have been built into the procedures of this Manual to maximize its usefulness.

Once the forms contained in this *Manual* are completed in the evaluation process, they will then contain information that is comprehensible without transcription or interpretation. They are likely to be used for reference or other purposes by the users of the *Manual* who have no special machine-scoring equipment, and no in-

clination to use key charts or memorize special symbols.

- Evaluation forms are designed to allow modification or updating for subsequent evaluations.
- The usefulness of some of the forms to the center operations staff can be considered compensation for their work in completing the forms required to lay the groundwork for evaluation. If accurately completed, the Administrative and Supporting Services Information form, for example, could serve as a comprehensive in-house operating manual for staff. It would clarify lines of responsibility, give the location and organization of all kinds of records, record the names of consultants and resources drawn on in the past, and provide other practical information.

The whole evaluation process includes instruments for several types of feedback. The Program Objectives form, in which center personnel give their opinions on the reasons why some objectives are inappropriate or impractical, contains a device for feedback to policy-makers. This device provides predesignated channels for feedback from on-site staff to policy makers without casting the feedback into the form of an excuse. In addition, the Staff Questionnaire offers feedback that might pinpoint sources of staff morale problems.

### VI. Flexibility

This Manual is designed to be flexible enough to meet both the varied needs and orientations of its users and the requirements of good research. Flexibility is built into its use in six different ways, and its use is to be systematically varied according to the orientation and needs of the particular user.

The Manual is flexible according to: (1) the type of facility (center or home); (2) the extensiveness of the evaluation required or undertaken (the breadth of service areas to be evaluated), (3) the intensity of the evaluation (the extent of efforts to validate the data produced by the evaluation), (4) the nature of the agency originating the evaluation (for example, whether a center director is evaluating his own operation or whether a funding agency is evaluating the center to determine its eligibility for extension of funds); (5) the objectives or goals held up as standards in the evaluation; (6) the organizational status of the facility.

Examples of this flexibility are found in the following possibilities. A preschool teacher may evaluate her own classroom and staff by using a portion of the evaluation *Manual*. A small center may be evaluated by its director as a means of organizing his approach to service improvement, or as preparation in applying for governmental grants. The administrator of a large network of day care centers may require periodic evaluation of all the member facilities. A funding or governing body may require evaluation for accreditation or support. And a licensing official may regularly integrate portions of the *Manual* into the licensing procedures.

# **CHAPTER 2**

# Manual Development, Field Tests, and Revisions

This Manual was developed by an extensive inductive process followed by several revisions. Three documents were produced. the preliminary manual, the first revision, and the final revision, which is the present Day Care Evaluation Manual.

### **Preliminary Manual**

The preliminary manual was developed after reviewing many thousands of items from child development, day care, and Head Start materials, and by then selecting appropriate items for incorporation in it.

Some of the instruments of measurement chosen to evaluate day care were adapted from other sources. All were put into a form that would be easy to apply in the field and easy for the participants to complete. To the extent possible, respondents were required to check appropriate spaces rather than compose sentences, paragraphs, or lists. The forms resembled multiple-choice lists of possible responses. This format provided convenience to the respondent and helped to ensure a high level of comparability between responses from different sources.

The items chosen for inclusion in the instruments covered topics of general interest and not those peculiar to particular research points of view. At the same time, the items dealt with small, precise units. Above all, they had to fit into the design of the developing evaluation system.

Two major categories were used. One category covered practices considered to have a beneficial effect on children, the other focused on methods of measuring environmental and behavioral influences. Materials in the first category were based on authoritative sources of child care practices and recent research on child development, day care, and Head Start. Materials in the second category were identified by surveying the entire Educational Resources Information Center abstracts for the six most recent years. The bibliography lists these sources.

Each set of materials was subjected to three elimination reviews. More information was sought about each abstract that survived these reviews. Ultimately, information on each measurement was sorted into three systems: by topic of child development or child care

to which it was relevant, by measurement styles (check lists, observation techniques, etc.); and by the instrument from which it was originally adapted.<sup>3</sup>

The preliminary manual was developed by adapting selections of these various materials and by designing original items where they were needed.<sup>4</sup> An abundant number of approaches to assessing each facet of day care was included to increase the likelihood of adequate coverage after the eliminations based on field test findings.

### First Field Test

The preliminary manual was pilot-tested in its entirety, with the exception of one form that was likely to cause dissension among facility staff.<sup>5</sup> The pilot test was conducted over a three-and-one-half month period. Fifteen day care centers and nine day care homes participated.

The original plan for the field test required facilities in the following cagegories: proprietary doctore centers, day care centers receiving grants-in-aid, day care homes supervised only by licensing personnel, and day care homes supervised by social agencies. Originally, all day care homes participating in the test were to have at least two normal children between the ages of three and five in regular attendance. This criterion was abandoned when it was found that the day care home clientele and their attendance patterns were a great deal more irregular than had been anticipated. Had these requirements been retained, the subsamples of day care homes could not have been found, despite the cooperation of local licensing personnel. Many homes cared for children younger than two years, and many cared for children who attended irregularly.

The observers or interviewers were selected on the basis of their experience in child development and day care. They were trained intensively for three full days. Subsequent training and supervision of the observer staff were given in conjunction with weekly half-to-full-day feedback sessions during which the field test events of the week were discussed in detail and adjustments were made in the test instruments. Reliability was built into the process by stipulating that all field tests were to be conducted by a team of two and that their judgments were not to be discussed until they met in the feedback sessions.

The observers were asked to note and report relevant examples and anecdotes, all of which helped to reveal to the supervising staff whether they understood the kinds of judgments they were to make in completing the forms. This feedback also helped to test the clarity and usefulness of the forms. All feedback and supervisory discussions were committed to detailed notes, which ultimately, along with analyses of the completed forms, served as a guide in revising the manual. General training procedures and related problems in field application of the evaluation instruments are discussed in Chapter 4.

Many measurement systems are derived from previous ones or were constructed to make up for their weaknesses, in which case commentaries on the original measures generally accompany the derived ones. The measures related to or commenting on one another were sorted together.

 $<sup>^4</sup>$  I headiscussion of the forms in Chapter 3 indicates which materials were used directly in the construction of particular forms.

<sup>5</sup> This form was the Staff Questionnaire. In an actual evaluation, resultant dissension could be resolved and used as motivation to correct sources of low morale.

To test the preliminary manual as a system of procedures (and not just as a collection of forms), the field test was conducted as though it were a genuine evaluation of the subject facilities. The forms used as background and for scheduling the remainder of the evaluation instruments were mailed to the facilities. One original form asked for schedules of the children's day. In centers, the form also determined which particular group of children were to be observed.

The best test of the preliminary manual required the cooperation of the staff of the facility. Their serious efforts and thoughtful comments were needed. In fairness, and also to prompt their feedback, it was also crucial for them to realize that the field test was an evaluation of the manual, not of them. This point was stressed in all contacts with the facility staff.

At centers, visits were arranged in keeping with the wishes of the center directors, and efforts were made to ease the tension associated with being evaluated. Nevertheless, a majority of key personnel in the centers visited appeared to be intentionally putting their best foot forward. Although some discomfort was probably experienced by center personnel, which was unfortunate, this resemblance of a field test to a genuine evaluation adds to the veracity of the pilot test of the manual. One circumstance did tend to minimize discomfort the facility staff invariably seemed to assume that the observers were watching the children instead of them, which usually was not the case.

While day care mothers displayed somewhat less discomfort in being observed, serious scheduling difficulties arose out of the irregularity with which parents brought their children to the day care homes, the variability in duration of daily attendance, and the likelihood that the activities in the home followed only a sketchy schedule.

The revised procedure for scheduling visits and administering the instruments in the pilot test was as follows: Two weeks after the background forms were mailed, telephone contact was made with the facilities. If the forms had already been returned, clarifying questions were asked concerning the answers. If the background forms had not been returned, they were completed over the phone as far as possible. One purpose of these phone contacts was to "break the ice" and assure the potential sample members that behind the impersonal letters they had received were sympathetic human beings who were grateful for their cooperation. These conversations attempted to establish a "research alliance" between the staff and the personnel to be observed and to emphasize their mutual concern for improving the care given to children.

This personal type of contact at the outset was considered very important in getting the field test in full operation. Once the first visit was scheduled, the relationship developed on the site between the observer and the caretaker staff served as the basis for determining the time of subsequent visits. The observers were instructed on how to establish good working rapport with the day care staff and were encouraged to use their best judgment of situations as they developed in order to retain the facility as a part of the sample.

The interviewers were instructed on the number of times each form was to be used and the setting and duration of time required for completion of each. Two full days at each facility were required as a bare minimum.

Once the field test was in full swing, the interviewers pointed out that the day care day is a long one in by definition, longer than an average working day. Team members were allowed to relieve each other on full-day site visits in the following way. One would be there as the children arrived and ended her day at 4:00 P.M. The other arrived around 9:00 A.M. and then stayed on into the later hours.

With only a few exceptions, the interviewers arranged their own appointments to gather information required by the forms. When forms were administered by the coordinating project staff, the interviewers or observers familiar with the facilities were consulted on the preferences and capacities of the facility staff to be contacted. Several members of the project staff observed and helped facility staff to complete the forms that were designed for completion without outside aid. Why this assistance was needed—whether for reasons of language usage or format style—was noted and included in the materials used for revision.

The preliminary manual was then entirely revised, and the second test manual was field-tested under different circumstances,

### Second Field Test

The second field test was conducted to test the revised manual and its organization and to test its feasibility as a self-administered procedure. The participants received no substantial training on how to use the forms other than the instructions provided within the manual. Because the earlier field test had exhausted the local supply of licensed day care homes willing to participate, the revision was not pilot-tested in the day care home situation.

Day care centers participating in the second field test were located from several sources. The Illinois Department of Children and Family Sources (IDCFS) Day Care Unit offered to locate local centers and assign three interns (child development students) to conduct portions of the pilot test of the revised manual. All five forms requiring observation were administered at each of four local centers, by teams of two students. Arrangements for conducting the pilot test and the manner of obtaining and recording feedback were similar to those used in the first field test, with the exception that the observers received no assistance or training from the project staff until after they had studied the manual thoroughly on their own. Then the only directions given were on which forms to administer and the time span and situation required for their completion.

During the course of the project, many letters of inquiry were received from day care centers, planners, researchers, and early-childhood specialists throughout the United States and Canada. Those who were considering the evaluation of centers were invited to conduct a pilot test of the revised manual. Three centers located in two Southern states participated in the second pilot test. Several others reviewed the manual and submitted their critical comments. Five additional local centers took part in the second pilot test. They were recruited on the basis of their previous contacts with the project or with the Council for Community Services.

The portion of the second pilot test administered by students assigned by the Illinois Department of Children and Family Services was conducted similarly to the first field test

'(mmus the intensive training, of course). The project staff was much more detached from the other observers in the second pilot test. While the participants were assigned evaluation forms, each was also allowed to choose additional forms in accordance with his interests and needs. Participants selected their own interviewers and their own methods of training and securing preliminary feedback, being guided only by draft materials being prepared for the manual. Feedback to the project (except in the case of the interns) was achieved by the completed forms and by telephone discussions with the individuals who supervised the observers.<sup>6</sup>

Twelve centers took part in the second pilot test. All forms and procedures in the revised manual were field-tested. All twelve centers tested the forms considered most important and the ones that had undergone major revision. The other forms had been distributed proportionately and according to interest among the participants.

The second pilot test included a broad range of day care center facilities. They varied in size and sponsorship or affiliation (religious, university, state grants-in-aid). The observers were advanced undergraduate students with majors in child development and experience in day care, beginning students in the social science field with limited day care experience, practicing psychologists, early-childhood specialists with considerable prior experience in observing day care programs, and directors of centers.

In addition to the actual pilot test and the collection of critical comments from those who had at one time or another anticipated taking part, the revised manual was also submitted to the review of selected local authorities on day care, child development, and measurement

Throughout the whole process, all types of feedback data from both field tests were organized by form, by item, and by organizational procedure.

### Data Analysis and Revisions

The real findings of a pilot test of this type concern the clarity and dependability of the forms and the design for their application.

All responses and organized feedback data were inspected and tabulated to reveal the following characteristics for each item and form:

- 1. Clarity of language and format
- 2. Completeness of responses and causes of incomplete responses
- 3. Ability to differentiate between individual facilities
- 4. The need to collapse categories or responses
- 5. The need to expand or create subcategories
- 6. Vulnerability to encouraging response-sets on the part of the respondents
- 7. Location of items requiring better definitions and examples

<sup>7</sup> Including the Staff Questionnaire which had been held back in the first field test.

<sup>&</sup>lt;sup>6</sup>One exception was a local facility whose director wished to be debriefed in person so as to provide a learning experience for her own trainces.

The forms completed by observers were also analyzed to see if they were reliable enough that ratings taken by different observers agreed. The three forms dealing with observation of program in action were also analyzed to determine whether the phenomena observed were consistent enough from time to time to warrant their being included in an evaluation

As the feedback sessions got underway it became clear that small revisions, deletions, and additions to the forms would be required throughout the field tests. Once it was discovered, for example, that a particular observation could not be made under the prescribed conditions, it would have been foolish to continue using the original instruction. Furthermore, the possibility of testing the ability to measure particular topics under conditions in which they could have been observed would be diminished.

The continual redefining of guides to the observers' judgments was more important than having two pools of strictly comparable data. Had the sources of misunderstanding been merely noted and held for the major revisions, a clear-cut definition of the essence of each judgment could never have been reached. Some items required many revisions, which could not have been achieved in a simple two-step plan. The dates on which the various interim revisions were instituted were contained in summarizing tabulations used for the analyses of the two complete revisions. The minor revisions therefore did not interfere with the refinement procedures and, in fact, aided them, since the forms were improved after each feedback session.

In the first field test, agreement between raters increased as the supervisory and feed-back sessions progressed. Even in the early stages, there were blocks of items upon which both raters in a team agreed almost perfectly even though observers from different universities were often intentionally teamed together. When very good agreement was found, the points in the judgment scales were increased in number and the use of extreme decisions to test the limits of reliability was encouraged.

Lach aspect of the manual was discussed at the fee dback sessions. All disagreements were discussed in detail until they were resolved and the direction necessary for improvement was manifested. The discussions and the exchange of anecdotes occasionally revealed that an item or procedure had been misunderstood, while the relevant form had been scored in such a way that this discovery would not have been made without the debriefing. All members of the coordinating and project staff felt that the manual was substantially improved through its many minor and two major revisions. The final revision was judged by the staff to be satisfactory to outstanding in reliability, scaling, comprehensiveness, validity, emphasis, and ease of application.

The development of the *Manual* through revision of the individual forms is discussed in Chapter 3.

# **CHAPTER 3**

# Functions and Development of the Forms

Lach form in the Manual serves a specific function in the organization of the evaluation system. Most forms also could serve other research and operational purposes. The forms have been divided into major sections in the Manual according to their major functions and topics.

This chapter discusses the forms in order to highlight their major functions. It also summarizes the development of the forms and describes examples of their more specialized uses. The summary of how the forms were developed and the list of references to the source materials gives the potential evaluator a sense of the logical framework on which this evaluation system is based.

This discussion will also aid researchers who are contemplating the measurement of similar phenomena or are facing constraints similar to those imposed on this project. The identification of source materials and the rationale for some decisions should reduce some of their preliminary work.

All forms used in the Manual are listed in Chart I.

### Identification Forms

Forms 1 and 18 collect general identifying information on the facility and the clients. When the *Manual* was being developed, they were also used to determine if the facilities to to be observed were qualified according to their clients' age groups, numbers, and freedom from handicaps, as stipulated by the project. The preliminary version of the forms also required a schedule of activities and other information to help in scheduling the facility's participation in the pilot test. They were designed to arrive at average figures on capacity, enrollment, and attendance, and to designate which of the groups in a multigroup facility should be chosen for the pilot test observations.

The revised identification forms as presented in this Manual are streamlined versions of the preliminary forms. They request identifying and qualifying information and identify separate groups in the facilities rather than determining which group should be observed, as it is recommended that all groups be observed in making an evaluation.

### **Objectives Forms**

The primary function of the objectives forms is to establish the standards by which day care services are to be evaluated. The project did not presume to dictate goals or objectives for child care to those providing the care. Rather it provided a collection of possible objectives distilled from the work of leading experts in the field. It allows for choices to be made from among these possible objectives to establish the particular set of objectives to be used in the evaluation of each facility. The measurement of objectives that are so basic to the provision of the child care that they should not be left to choice or are potentially destructive yet widespread are built into the scoring system.

The preliminary objectives form was constructed as part of the inductive process described in Chapter 2. Abstracts were made from two types of literature: (1) guides to providing day care and guides to training for and evaluating day care services; and (2) summaries of research on child development, early education, day care, and Head Start.

In compiling the abstracts, materials were collected that referred to any facet of day care. Each statement about what ought to be done was either quoted or paraphrased. These statements came to be known by the project staff as the "ought to's." The research summaries were abstracted in a more indirect manner. Using the nineteen socioemotional, perceptual-motor, and cognitive objectives for preschool education offered by Kamii's analysis (1971) as locators, each study claiming an improvement effect was examined to identify the treatment to which beneficial effects were attributed. These treatments or ways of dealing with children were qualified by any special circumstances that existed in the studies from which they were drawn and were then collected as abstracts. This type of preliminary objective came to be known as "research findings." The entire collection of abstracts was then submitted to a condensing and level-setting procedure. Objectives to be used in the Manual had to be sufficiently specific and operational to be identified with recognizable behavior and practices and to overlap as little as possible.

The various steps required to establish a workable list of objectives, the collapsing of categories, the deletions of repetitious material, etc., yielded a list of seventy-six items expering all phases of day care. These were divided into items pertinent to administrative and supporting services and items pertinent to direct program. Objectives pertinent to administrative and supporting services were stated in concrete terms. Objectives pertinent to direct programs were stated in more abstract, less specific terms. More of the administrative and supporting services items were derived from the "ought to" collection; and more of the direct program items were derived from the "research findings" collection.

After testing and revision, most of the preliminary forms developed to collect objectives from day care mothers had to be eliminated. Of these forms, the Day Care Home Activity Inventory (now Form 20) was retained. By itself it cannot be used to establish objectives, but it was found in the pilot test to actually remind some day care mothers of things they might do with the children, and since that was an intended minor function of the objectives form, it was retained.

The method of inquiry built into the remaining objectives forms allows for the facility to be evaluated by standards set by formal contract or policy, by the director's opinion of what is important, or by what the actual "working objectives" of the facility are. The data

collected by these forms also lend themselves to discovering patterns of agreement between these three sources.

A special function of these forms is that they are designed to transmit the opinions of the staff concerning the suitability of particular objectives to the policy-making bodies. Thus, the forms are useful in realigning priorities and negotiating for outside services that might be needed to meet particular objectives.

### **General Operations Information Forms**

Form 6. Administrative and Supporting Services Information form (In-House Operating Manual) for centers, is the core form of this section. Its nine parts cover the following topics. (1) licensed status, and frequency and types of visits from licensing personnel, (2) whether the center is endorsed or certified as having attained standards other than those set down as minimums by the state and city. (3) areas in which an outside agency or individual provided consultation or actual service, (4) titles and location of any operating manuals or contracts used by the center, (5) whether the center is affiliated with or sponsored by some other organization, and a description of the relationship, (6) child, staff, and volunteer recruitment and assignment policies, procedures, and problems, (7) description of parent, volunteer training, staff, and advisory board meetings as well as personnel practices, (8) type of food service and nutrition program, and (9) the location of, and the persons responsible for maintaining records on all these topics.

Most sections of this form begin with an inquiry about whether the center uses a certain procedure or offers a particular service. If the response is affirmative, detailed questions about the procedure or service are then to be answered. While the questionnaire is lengthy, care was taken in its design to ease the task of responding. directors are to respond by checking boxes, filling in names, dates, or figures, and only occasionally by writing short statements.

This instrument establishes numerous organizational and procedural parameters of a center's operating system. The types of services and the approaches undertaken to accomplish them and the location of documents indicating that these services are in fact being provided are all contained in the completed form. The location of documentation is a crucial feature of the form as it provides for verification of responses, and should imply this possibility to the respondent.

Because of its precision, this form requires the expenditure of more time by center personnel than is usual in preparing for an evaluation. But in subsequent evaluations using the same system, the information would only have to be brought up-to-date. The form also makes it possible for the center director to inspect many possible approaches to organizing and conducting procedures for delivering services. The completed form would function as an in-house operating manual, spelling out exact procedures, location of materials, and lines of authority.\*

The form prepared for use in day care homes, entitled Licensing Questionnaire (Form 21), includes some of the same topics as the day care center Form 6. Day care home Form 22, Administrative and Supporting Services Information (to be completed by the supervising

agency), includes such topics as the type and amount of supervision, records, guides, and services provided by the agency for day care families. Detailed questions are asked when the agency indicates that it provides any of the following services: recruitment of children, day care mothers, assistants, or volunteers, training and evaluation of caretakers; licensing; determining client fees for day care services; and maintaining contact with parents.

### Staff Questionnaire Forms

The Staff Questionnaire forms (Forms 7 and 23) are designed to serve three interrelated tunctions. (1) the partial verification of selected information gathered by the general operations information forms, (2) staff knowledge of the procedures that directly affect them and the performance of their jobs, and (3) an inquiry into the morale of the staff and sources of dissatisfaction.

The form for day care centers is to be administered to teachers, aides, and volunteers who serve regularly several times a week.

The form for day care mothers ascertains whether the supervisor or licensing official has encouraged her to contact him when certain problems occurred, and whether she knows of any services offered by the supervisory agency. It attempts to verify selected information collected by the Administrative and Supporting Services Information form for the agencies supervising them.

### **Physical Facilities Forms**

These forms were designed to note the adequacy of the equipment and physical facility, and their probable influence on the children.

The forms in this section were more drastically revised than those in any other section. The final forms constitute a simplified, cohesive subsystem, with the lead forms directing the circumstances under which the remaining forms should be used.

A check sheet contained in Form 8 is used to determine which of the forms in this section will be used in centers. A check sheet contained in Form 24 is used to determine which of the forms dealing with the physical facilities of day care homes are appropriate to use. These lead forms also collect information on climate and season, which should affect the scoring on use of physical facilities.

The forms dealing with the organization and use of space collect specific information that bears on the planning and maintenance of space from points of view of appropriateness, variety, flexibility, ease of surveillance and supervision, and pleasantness. The indoor forms (Forms 9 and 25) particularly explore the use of display materials and activity areas. The outdoor forms (Forms 12 and 24) particularly inspect the potentials in the area immediately surrounding the facility and do not deal with display materials.

Many of the items in these forms ask for direct judgments that, in preliminary versions, were to have been more indirectly judged by raters using maps of the areas. (Since the maps drawn in pilot testing required great investments of time and yielded uneven results, the intermediary step of map making was eliminated.) A play area observation form, which was to have been used in conjunction with these forms and which was (1) to determine problems induced

by space and equipment, and (2) measure children's reactions, interests, and involvement in relation to spatial organization and equipment, was also eliminated. The scan sampling procedures as used in the field test presented some drawbacks to the administration of the form. But more important, it was found that incidents selected as focal by the scanning were often inaudible and could not be properly judged. Topics that would have been covered by this form were transferred to the more informal program observation forms.

The forms that inspect the locale of the facilities (Forms 10 and 26) collect information on the building in which the facility is housed, and on the population and nature of the neighborhood. The earlier versions of these forms were more lengthy and required a survey of the surrounding neighborhood. This process worked a hardship on observers without cars, and since day care facilities seldom use distant neighborhood resources on a regular basis (except for parks, which are covered elsewhere), a narrower version of this form was devised for the *Manual*. It requires that the observer approach the facility mindful of its environment, rather than requiring a survey with a given radius of the facility. Some of the data collected by the Locale forms are not directly pertinent to probable goals or objectives for day care. Instead they provide the ability to categorize the facilities in ways most meaningful for comparative research.

The form on Organization and Use of Gymnasium or Gross Motor Activity Area (Form 13) was constructed as an offshoot of Form 12 to cover centers that lack outdoor equipment or have no daily access to a park. It can also be used when the climate or season does not allow outdoor activities during the evaluation. The inclusion of this form ensures that the provision of large-muscle activity can be observed, regardless of the setting in which it is provided.

The Equipment, Supplies, and Activities Check Lists (Forms 11 and 14) constitute a comprehensive inventory of useful equipment and activities. The forms also offer a way to evaluate the safety, accessibility, adequacy in number, workability, and variety of equipment and activities. Other forms examine the flexibility and creativity with which the equipment is used by the staff. This form can help in describing the variability and nature of the activities undertaken. Used in conjunction with the program observation forms, it evaluates the appropriateness and quality of these activities.

The indoor and outdoor versions of these check lists duplicate each other so that all equipment and activities, wherever they occur, can be included. The indoor and outdoor environments and activities can also be evaluated separately. Duplication also permits comparisons between evaluations of facilities in different climate zones. In this way, activities that are commonly considered indoor ones but are conducted out-of-doors in warm climates, can be compared with the others in different circumstances.

Forms 11 and 14 underwent the most extensive revisions of all those still included in the Manual. The first instrument pilot-tested for its ability to evaluate equipment included a comprehensive list of equipment that was to be rated in a manner adapted from the work of Prescott and others. The study by Prescott, Jones, and Kritchevsky (1967) suggested organizing principles and basic definitions to deal with a complexity rating of the arrangement of play areas in reference to their play units, divided into three distinct types: simple, complex, and super.

This method was thought to offer several advantages and to furnish information on several levels. the actual equipment present; its workability, variety, and accessibility; and the complexity of the environment created. Numerous additional sources were used in drawing up the list of materials and equipment for these forms, determining categories for variety, and considering ways of evaluating special problems associated with the equipment.

This early version proved to have two major failings: the observers could not agree well on categorizing the play units into simple, complex, and super; and the data, once analyzed by these units, did not adequately differentiate between centers.

A companion form calling for the inspection of housekeeping equipment and supplies and other supplies stored inside closed storage units was also eliminated since searching or direct questioning evoked a negative response on the part of the caretakers.

In the second version of the forms designed to evaluate equipment, the attempt was made to analyze the functional potential of the equipment. Functional categories were derived from several sources. works on play therapy, lists of areas of learning abilities, and a study that analyzed approximately 350 toys according to the physical abilities and muscle group needed to play with each toy according to interest levels at various stages of development. The first set of categories on the potential function of equipment, which concerned physical growth stages of development, was adapted from these sources.

The second set of categories for this version of the form was adapted from Piaget's manipulation potentials involved in sensory-motor skills and cognitive development, such as discriminatory, relational and sequential skills, and basic concepts of position, quantity, size, ordering, and classification.

The third set of categories developed out of previous work done by the project staff including the exploration of an instrument that observed teacher-child-equipment interaction, noting toys and equipment whose use illustrated basic physical forces, simple machines, or physical and chemical changes. Two physics textbooks were consulted for definitions and examples of the topics mentioned above, and experimental science curricula for children were consulted.

A fourth set of categories, life experiences, was added since so many day care guides suggest, that children should have an opportunity to play at real life experiences.

Functional subcategories were defined and examples of equipment exemplifying the functions intended were listed. Catalogs of equipment were inspected as sources for the equipment lists to guarantee that a wide variety of examples were furnished on the form. Each subcategory was to be rated on a three-point scale and each major category on a sixpoint scale.

The local pilot tests using this form were successful, but a number of personnel having less training and less contact with the project than the local observers found it confusing, and the form was therefore eliminated from the Martual.

An equipment and materials form that asked for general impressions about the kinds of activities encouraged by the materials themselves and by the staff's expressed attitudes towards the children's actual use of the equipment was used as a companion form during most of the pilot tests. This form was included primarily to see whether such an instrument, which was

quite short and easy to administer but relatively nonobjective, agreed with other, more difficult forms that covered the same topics, and could therefore supplant them. This version tested relatively well in the field tests, but was eliminated in favor of the more specific listing of equipment. A number of the facilities found the specific listings in the final version of the form more helpful in planning and in inspection of their own operation.

### Program in Action Forms

Observation of Group Experiences and Individual Caretakers. Program observation Forms 15 and 16 consist of seventy-three observer ratings of various aspects of the day care program that emphasize the staff's role in cognitive, social, and affective situations, and the division of responsibilities and interaction between teachers and aides. The rating system was adapted from a group of scales used in scoring observations in a study on Head Start evaluation by Stern and Gordon at the Bank Street College of Education.

Before selecting this observation instrument for inclusion in the Manual, the project staft examined in detail more than forty observation instruments and coding schemes complete with commentaries, selected from over 3,000 originally inspected. The adaptation finally selected for the observation instrument has these benefits. (1) it is broad in scope, (2) it lends itself to definition and redefinition of the scales through feedback and consensus in order to increase rater reliability, (3) it provides for evaluating various types of programs and orientations, and (4) it provides understandable information without the necessary use of further coding.

Originally it was intended that these forms, used to observe the caretakers in action, would resemble a number of the atomistic, objective systems for behavioral observation currently in vogue. The *Manual* would then benefit from the well-known, positive attributes of these types of recording or scoring systems. An overwhelming majority of the materials reviewed dealt with objective, behavioral observation systems focusing on small units of behavior.

. (ertain benefits are usually associated with objective behavioral observation systems. The following attributes were considered in developing this observation form:

- 1. Behavioral observation scales are objective. These scales ask for the observation and recording of behaviors that can be made by observers whose experience and judgment are minimal. To paraphrase a proponent of these scales: it is easier to tell if a child is smiling than to tell if he is happy. Raw data from this type of scale are presumably in a form closest to behavior and at the lowest level of theoretical abstraction. The observer is not required to judge what is psychologically significant behavior. Inspection of the instrument need not reveal what is to be considered as relevant by data analysis. It is left for analyzers of the data to code, formulate, and weight the analysis to put theoretical or psychological meaning to the data.
- 2. The process of using behavioral observation scales is equitable. The process by which judgments on observed behaviors are coalesced is in many respects more equitable than the parallel process in the more subjective systems that rely heavily

on the impressions of the observer. For example, a subjective system might require the observer, after a period of observation, to respond to such broad and judgmental question as:

- -- Does the teacher suit her presentation to the developmental level of the child?
- Are children treated in a manner that will engender a positive self-concept?
- Are the children being taught skills that will help them when they get to school?
  - Is creativity encouraged in the children?

An objective system, on the other hand, requests the observer to note each behavior or interaction in a specified manner without judging it further. (The length of the observation period is also specified.)

One of the first modern objective behavioral observation systems was developed by Barker and others. This system dictates that a running process record describing behavior as fully as possible be written concurrently with the observation. Later, the record is broken down into simple behavioral units and the units are then categorized according to the particular purpose for which the observation is being used.

One recent, highly developed system is OSCI (Head Start Evaluation and Research Center, 1969). In that system the observer is directed to record, at three-minute intervals, multiple aspects of observable behavior for all individuals or subgroups present. Examples of these are the locus of power in the interaction or group activity, the context of the activity, and the content matter of the activity. Each category is equipped, with a set of items from which the observer must choose. Notations are taken on graphic configurations that are designed for ease and completeness when used by observers practiced in the use of the system. The observation is paced and the observed behavior sampled by strict timing.

The OScAR observation system (Medley, 1963), another recent and well-conceived system, commits to machine-scorable shorthand all verbal interchange taking place in a classroom. Again, the choices for description are predefined and multifaceted, each aspect requiring some determination. For example, who initiated the interaction, the emotional quality of the interaction, the content area, and responses to it are all noted in a prescribed manner.

The PROSE system, an outgrowth of work on OScAR, is particularly suitable to observation in preschool settings. PROSE is being developed by the Educational Testing Service. This system observes each child singly in a number of cycles and the general group character secondarily. Besides describing the child's behavior and interaction in small units, the system permits the recording of many significant influences that might impinge on the child. The observation notation is paced and the behaviors observed are sampled by a timing device — a precise

time cycle schedule and a stopwatch.

In these systems the observations are broken down into units that can be considered equal. A judgment based on the statistically compelling processes of mounting one unit upon another to measure magnitude engenders more confidence than one based on an unknown individual's judgment—which might be biased by theoretical predilections, personal experiences, auditory volume of interchanges observed, or the vernacular used for their expression.

3. The data collected by objective systems are particularly suitable to statistical manipulation. The basic and nonjudgmental nature of the data generated by objective systems, and the fact that the data are in the form of a large collection of small units, makes statistical manipulation more legitimate.

Some proponents of these systems also point out that by breaking down the motivations and procedures inherent in the various approaches to child care into components that are either identical to those in an observation scale (or composed of a combination of those scale components), the ability to measure the extent to which these defined approaches are expressed in the setting observed becomes very feasible.

All well-articulated approaches to child care could technically be dissected in this manner. The typical subjective observation system, addressed by proponents of objective systems, was composed of items far too general and lacking in the ability to finely delineate behavior into quantifiable units.

In addition to these three beneficial features, the project staff kept one further point in mind in its search for suitable observation instruments. The day care staff and the direct program were to be observed. Observation of children was deemphasized and employed only where required to most accurately judge staff behavior or service delivery. This approach giew from the premise that this *Manual* was to be an evaluation tool to assist decision makers in evaluating the *presumed environment* of the child rather than the child's behavior. Measurements of interactions between child and staff are of value only to the extent that they help to define and secure the quality, meaning, and appropriateness of each unit of program observed. To do otherwise would lead to the possibility of penalizing facilities willing to include children who are unlikely to make a good impression.

The PROSE scoring system and a system originating in the Bank Street study were judged most suitable for adaptation to this Manual's purpose. The PROSE system appeared to have the ability to segment important child experiences and the flexibility to allow these segments to be ordered in various ways for analysis. The Bank Street work appeared to be a tool for preliminary analysis of behavioral units, it had a great potential for organizing data in an effective and cogent way. It is extremely comprehensive and the categories it provides are narrow, precise, and well-defined.

The staff set out to adapt the PROSE and Bank Street systems to the Manual's purposes. One scale was to be used for recording observations and the other for the general descriptive organization of the data. One of the first tasks in this process was the pilot training of one staff member in the use of the PROSE observation system to ensure that it could be used in

an automatic way by observers in the pilot tests and by the observers for whom it was ultimately intended. The instrument requires numerous small decisions for the completion of records on each minute cycle, and this feat could be accomplished only if the scoring could become second nature to the observer.

The pilot training did not run smoothly: training to a point of agreement with the instrument's criteria could not be achieved. Much more intensive training seemed to be required if reliability was to be improved. Since the ultimate users of the Manual will receive no more training that what can be contained in the Manual, the prospect of adapting this system became less attractive. Further attempts at training were held in abeyance for reexamination and potential replanning. The attractiveness of the Bank Street instrument and the benefits expected of the objective scales were reconsidered.

It was finally decided that an adaptation of the Bank Street system used alone as an instrument, rather than as organizer of data, would possess the attributes the project sought in a scale. Each point of benefit originally thought to reside only in the most objective and atomistic systems were found in actual practice to be operant in the somewhat more judgmental scale devised, and the scale devised seemed to possess some particularly unique benefits as well.

This adapted scale formed the nucleus of the final form. Finely graded revisions were made throughout the two pilot tests.

Observation of Routine Activities: The Observation of Routine Activities forms (17 and 27) assist in the observation of arrival and departure activities, toileting, food preparation, mealtime atmosphere, nap time, and staff handling of sick children. These forms were included in the *Manual* because such observations are seldom part of formal observation instruments, even though routines are presumed to have a strong impact on children. Observers respond to the questions by supplying figures, checking boxes of cartain activities where observed, or writing brief descriptions of how the staff handled certain problem situations.

During the first field test, the form used to observe routine activities taking place in day care homes was exactly the same as that used for centers. This form was difficult to complete in day care homes. Most day care mothers refused to allow the observers to be present when the children were arriving. Many others did not like the observers to be present at meals, nap times, and departure activities. Thus many questions on this form were completed by interviews or were left blank.

Despite these difficulties, this form was retained in a modified version, for two reasons:

(1) the evaluator will probably be in a position to request permission to be present at mealtimes and other routines; and (2) routines usually require the day care mother to interact with
the children, regardless of an outsider's presence. While an observer's presence might disrupt
play activities in the day care home, the routines are more likely to be carried out in the
usual way, thus allowing the evaluator to observe the day care mother and children in the
way they normally interact. If the evaluator must choose which routines to observe, the
arrival and departure activities could be skipped. These activities are most crucial when new
children are entering day care, and are less important in homes where the children's parents

live in the same building or neighborhood and have other opportunities for contact with the day care mother.

### **Source Materials**

The original sources of materials that were most influential in shaping the character of the forms are grouped by the category of form they most influenced.

### -CHAPTER 4

### Application of the System

### Complete and Abbreviated Evaluations

In the integrated system that constitutes this evaluation Manual, each part meshes with other parts and facilitates their administration. The sections of the Manual are interrelated in two ways. in the internal logic of the evaluation system, and in the economical use of evaluation time.

The following sketch of a complete evaluation process illustrates the interrelationships: First, it is ascertained that the clientele of the subject facility falls within the normal range of a day care population (identification forms). Next, objectives for service are collected from supervisory personnel (objectives forms). These objectives provide standards for the evaluation. At the same time, the supervisory day care personnel give their opinions regarding impediments to fulfilling the objectives.

Specific information is collected regarding the services undertaken, the procedures used to accomplish them, and the specific location of records (general operations information forms). Then data are obtained that verify the operation of reported service procedures and pinpoint likely sources for problems of staff morale (staff questionnaires).

Each group's facility and equipment, and the uses fo which they are put, are observed by an evaluator who notes information bearing on their suitability and developmental potential (physical facilities forms). At the same time, observations are made on the delivery of the program to each group of children through their interaction with staff and activities (three forms in program-in action section). Data collected directly from the facility or supervisory staff are verified by comparing information from two sources (administrative and supporting services information forms and staff questionnaires), and by spot checks of records (the records are located by means of information contained in the program in action section).

The verified data plus the data collected by the observation staff are scored against selected objectives (collected by the objectives forms and auxiliary objectives built into the coding system). The analyzed data are then fed back to the appropriate sources, hopefully after they have been compared with identical data collected at other day care facilities.

The Manual also was designed so that parts of it could be used in an abbreviated evaluation process. This was to be done without sacrificing the validity of the data collected and without seriously affecting their comparability with the portions of the data collected in a

ERIC

Full Text Provided by ERIC

complete evaluation.

All forms are outlined in Chart II (see the end of this chapter) to guide the users of the Manual in planning and administering their evaluations, whether they use the complete evaluation or parts of the system to evaluate particular services. The column headings, which are described below, cover the types of information that the users must have to reach informed decisions on the application of the evaluation system. The validity of the scoring system depends upon strict adherence to the instructions contained in Chart II.

Eacility. Indicates whether the form is to be used by a day care center, a day care home, or both.

Completed by Indicates the title of the appropriate recorder or person who is to complete the form. Note that in several cases the respondent differs from the recorder, for example, when an observer completes a form by interviewing a day care mother.

Functions. Notes the major and minor functions of the forms regarding the topics covered and the organizational purposes in the total evaluation. Users should compare their needs for evaluation with these functions. Uses built into the forms that are superfluous to their evaluation are not included here.

Observation Time Required. States the time spent in observation required to complete the form. Not all forms require observation for completion. Where observation and form completion are normally accomplished at the same time, the timing for the combined task appears in this column followed by an asterisk (\*), and no separate notation appears in the column headed "Form Completion Time." For forms that combine observation and form completion, and in addition require separate recording after the observation period, the additional time required is noted in the form completion time column, followed by an asterisk (\*).

Form Completion Time. Indicates the estimated time required to complete each form. It is assumed that the observers are familiar with the forms and required judgments, and that day care personnel are familiar with the workings of their own agency.

Training Difficulty. Notes the relative investment of time and skilled personnel required to adequately train observers in the application of the various forms.

Concidental Observation. Indicates which forms may be used coincidentally. If a full day of observation is required for each of two forms, but observation for both forms is normally accomplished at the same time, then the only additional time spent on the second form is that required for additional training and the time spent in its completion.

Intalid Without. Indicates which other forms must be included in the evaluation along with the form under discussion. The one exception to this statement is that Form 1 (for centers) or Form 18 (for homes) must be completed in all evaluations, they are therefore not repeated under every entry in this column.

Administration Must Precede. Indicates which forms must precede others in administration or completion according to this evaluation design.

Estimate of Importance. Indicates the importance of the information gathered by each form in the light of field experience.

The initiator of the evaluation must decide, based on familiarity with the evaluation system and his evaluation needs and resources, whether an entire evaluation is to be performed or whether an abbreviated version is more appropriate.

Scoring of data on a form-by-form basis (which is discussed in Chapter 5) allows for comparison between varying abbreviated evaluations.

It should be noted before undertaking evaluation with this *Manual* that it was designed primarily for, and pilot-tested on, preschool day care programs. It does not address the special requirements of infant care or programs for handicapped children. While providers of these special programs will find many of the forms to be quite useful, findings from these programs should not be pooled together with those from the type of program for which the *Manual* was primarily intended.

### Training the Observers

Lifective performance as an observer requires some background in child development or early education, formal or informal experience in observing groups of supervised children; and a thorough understanding of the logic and content of the materials to be used.

Training of observers should include. (1) solid background information on the purpose of the evaluation, its guiding orientations, and its rationale; (2) general principles of observing; and (3) specific instructions as to when and under what conditions each form is to be administered. The background and rationale for evaluation have been discussed in Chapter 1. The specifics of administration are described above and on the forms themselves. This section discusses the general principles to be followed in making observations.

Punctuality. Punctuality is required of the observer since some observations require the presence of the observer at the beginning of the day. Tardiness on the part of the interviewer might be interpreted by facility personnel as a sign of disrespect or lack of interest. If the observer is kept waiting, she should realize that service to children is the primary function of the facility and that personnel are often imposed upon for observation by college classes, individuals writing papers, etc. The observer should not show signs of annoyance at inconveniences caused her by the operation of the center.

Respect. Observers should have respect for the ongoing program and routines in the centers and homes, which should continue as normally as possible in their presence. They should bring all necessary materials with them, such as paper, pens, a watch, and their lunch if they are to observe through the noon hours. The observers should avoid having to ask the teacher or day care mother to stop and furnish supplies for them. Any discussion with a caretaker should be initiated only after she has disengaged herself from the children for other reasons.

Detachment. While observing, the observer should remain unobtrusive and as physically distant as possible. She should show absolutely no judgmental reactions to what is observed. The teacher should be officially notified beforehand that the observers are not there to help her or to play with the children, and that they have been instructed not to do so. The observers should not be rude to children who do approach them. They may make a brief comment or a remark to the effect that the writing they are doing is work they have to do alone, this usually suffices as an explanation for children. At no time, however, should the observers initiate conversations or play with the children: their aim is to have as little effect on the situation as possible. The process of measuring should have as little effect as

possible on what is being measured. Satisfying this requirement proved to be more difficult in the day care homes than in the centers. The difficulty was compounded in the day care homes where the day care mother worked in another part of the house while the children were left where the observers had been situated by the day care mother.

Personal Appearance and Behavior. The appearance of the observers should convey respect for the caretakers in the centers and homes. Although dress must be practical for the observing situation (observers might spend part of the time outdoors, or sitting on the floor or in child-sized chairs) it should not be too casual. Deniin clothing is likely to be considered too casual by some day care personnel. The relationship between the observer and the observed is a delicate one which the observer should try to maintain as neutral. In the particular situation where the interviewee or person being observed is older or obviously more experienced than the observer, a situation uncommon in human experience exists, that is, it appears that someone less qualified is placed in the judgmental role. Courteous signs of deference on the part of the observer will serve to ease the situation. At all times, but here in particular, the observer should attempt to convey that she is. (1) interested and (2) merely the recording device of the evaluation instruments.

Impartuality. Experiences during the pilot test indicated the importance of not prejudging a center staff member or day care mother on the basis of her behavior toward the observers or toward the group sponsoring the evaluation. The behavior of the teacher as directed toward the children is the prime interest. Although care has been taken to incorporate objectivity into the instruments, observers should be aware of a possible tendency to give a teacher they like a good rating, or to allow their personal opinions of what is "good" and "bad" teaching behavior to influence their observations.

Legibility. The observers should complete all forms with coding ease in mind, particularly when someone other than the observer is to summarize the findings. Handwriting must be legible, explanatory comments should be written in the designated space so that there is no confusion about which question they refer to, and all corrections or changes should be clear. An entry should be made for every item on the forms or an explanation as to why it was left blank. All forms should be properly identified as to the facility and persons observed, date of observation (and time, where applicable), and the contributing observer. When two persons conduct observations simultaneously, information identifying the facility, etc. as filled in by both observers should agree exactly. Each form should remain securely stapled intact, unless it is dismantled for a compelling purpose, in which case each page should have the identifying information repeated on it. The first pilot test required each interviewer to use ink of a different color for purposes of quick identification. This device functioned well, but would be impossible with large evaluation staff.

Following Directions. Observers should be aware that directions concerning the duration, conditions, or spacing in time of particular observations are devices for sampling the behavior observed. They serve to maintain the equitability of the evaluation process and the comparability of the items contained in the forms. These directions should be adhered to completely.

# CHART II

# EVALUATIVE FUNCTIONS AND ADMINISTRATION OF FORMS

Importance	Very high	Hand	High	uan .	High	Very figh	Moderate
Adminis- tration Must Precede	All forms for centers

NOTE: Form I must be completed in all evaluations of centers. Forms 9, 11, 12, 13, 14, 15, 16, and 17 must be completed once for each group in the center. Form 18 must be completed in all evaluations of homes.

\* Observation and form completion are carried out at the same time. Timing for the combined task appears in column headed "Observation or Interview Time Required." Some forms require separate recording in addition, as noted in column headed "Form Completion Time."

### **CHAPTER 5**

### Scoring, Summarizing, and Interpreting

This chapter provides the means for extracting reliable information from the completed evaluation forms.

### Levels of Evidence

The validity of a finding from any evaluation or investigation rests on three factors:

- 1. The degree to which selected evidence is crucial to or definitive of the issue under investigation;
- 2. The number of corroborating pieces of evidence and the number of cross-checks between them; and
- 3. The degree to which the source of evidence is disinterested and objective.

These three factors, together with information concerning the importance of objectives in providing day care, guided the selection and organization of the forms to make efficient use of evaluation time. The same factors guided the design of the scoring system to make the most efficient use of the scorer's time.

The result is a system that pro 'uces evaluation findings based on five levels of evidence:

- Level 1 The staff's claim or implication that a service is provided knowing that records of verification may be examined.
- Level II Analysis of the staff's report of service delivery details.
- Level III Verification of delivery by analysis or inspection of related facility records.
- Level IV Corroboration by analysis of details reported by other facility or evaluation sources.
- Level V Analysis of observation by independent evaluation staff.

To illustrate, the attainment of an objective to provide a balanced food program could be measured by:

- 1. The claim by the director that a balanced food program is followed and her willingness to state the location of verifying records of menus, etc. (Level I)
- 2. Analysis of typical meals and snacks (reported by the director on evaluation forms) according to accepted nutrition standards. (Level II)
- 3. Analysis of menu files according to nutrition standards. (Level III)
- 4. Cross-check analysis of typical meals and snacks reported by staff other than director or her assistant. (Level IV)
- 5. Analysis of observer's report of what children were served and how conducive the service was to the children's consuming all they might require, etc. (Level V)

The certainty or validity of the findings increases as the level of evidence increases. There is also a positive relationship between the combined evaluation of scoring time required and the level of evidence used.

This evaluation system is designed so that:

- 1. Most of the objectives for day care can be evaluated based on several types or levels of evidence.
- 2. The evaluation of objectives measured with a single type of evidence tends to use the most reliable level of evidence.
- 3. The more central to day care an objective is, and the more direct its impact on children is likely to be, the more likely it is that the objective is evaluated using multiple and more reliable types of evidence.

### Find Choices for Evaluator

Many of the prerogatives of choice and flexibility offered to the primary evaluator are exercised in the choices of evaluation forms administered. Two specific areas related to scoring and summarizing offer the evaluating agent an opportunity to tailor the evaluating process to his needs and resources. the choice of what sets of objectives are to act as standards for evaluation, and the choice of which, if any, of the administrative and supporting services objectives are to be verified by inspection of facility records.

### Choice of Objectives to be Evaluated

The following summarizes the procedures and decisions required to establish the objectives of choice to be evaluated. For the guidance of raters, decisions reached should be recorded on Summary Sheets K and M.

Selection of Administrative and Supporting Services Objectives to be Evaluated for Center Care
If these services are to be evaluated for center care, the goals of the program must be
translated into the objectives provided by the Manual. The Manual's objectives to be evaluated
can be determined by:

- A. The responses of the center director (provided Form 2 is completed);
- B. The responses of the central organization supervising the center (provided Form 4 is completed); or
- C. All center administrative and supporting services objectives for centers listed in the Manual.

If objectives are determined by the center's director or the central organization, choose whether the *formal policy* or the *working objectives* of the center as translated into the *Manual's* objectives by the respondents (center director or central organization personnel) are to serve as standards for evaluation.

### Selection of Program Objectives to Be Evaluated for Center Care

If direct program services are to be evaluated for center care, the objectives and emphasis of the program must be translated into a ranking of the objectives provided by the *Manual*. The ranking of the *Manual*'s objectives by importance to the emphasis of the program intended can be determined by:

- A. The responses of the center director (provided Form 3 has been completed);
- B. The responses of the central organization supervising the center (provided Form 5 has been completed for centers); or
- C. The assumption that the Manual's objectives are of equal importance.

If the ranking of the objectives by importance to the emphasis of the intended program is determined by the center director or central organization, choose whether the formal policy or the working objectives for the program should set the standards for evaluation.

# Selection of Administrative and Supporting Services Objectives to Be Evaluated for Home Care

If administrative and supporting services are to be evaluated for home care, the objectives of the program must be translated into the objectives provided by the Manual. The Manual's objectives to be evaluated can be determined by:

- A. The response of the agency supervising the home (provided Form 19 is completed); or
- B. All day care home administrative and supporting services objectives listed in the Manual.

If objectives are to be determined by the upervising agency, choose whether the formal policy or the working objectives for home care as interpreted into the Manual's objectives by the respondent are to serve as standards for evaluation.

Selection of Program Objectives to Be Evaluated for Home Care

If direct program and services are to be evaluated for home care, the objectives and emphasis of the program must be translated into a ranking of the objectives provided by the *Manual*. The ranking of the *Manual*'s objectives by importance to the emphases of the intended program can be determined by:

- A. The response of the agency supervising the home (provided Form 5 has been completed for day care homes); or
- B. The assumption that the Manual's objectives are of equal importance.

It the ranking of the objectives by importance to the emphasis of the intended program is to be determined by the agency supervising the home, choose whether the *formal policy* or working objectives for the home is to set the standards for the evaluation.

Choice of Administrative and Supporting Services Objectives to be Verified by Inspection of Records

Thorough investigation of a number of the objectives in this category may invest evaluation efforts disproportionate to the relevance of individual objectives or transgress the limits of the facility and its staff in inquiry. Fortunately these objectives are the ones that most require the keeping of records for their adequate performance. The locations of records for verification are provided for those who wish to bolster the evaluation of these objectives with a verification of records. Your decision is likely to be based on the extent to which the objectives are evaluated as well as on their importance to you. Chart III displays the objectives and the levels of evidence upon which their evaluation is possible using the *Manual*, by forms needed. Record your choice on Summary Sheets K and M. It is suggested that your raters be instructed to rate the veracity of records on scores from zero to 5.

### **Guides and Restrictions for Manipulating Data**

One of the options offered by the Manual is evaluation on an individual and group data basis. Evaluation on an individual basis uses the information gathered from a solitary facility, evaluation on a group data basis uses comparable data collected from numbers of facilities. The first approach leads to findings on the nature and quality of the service provided in rather absolute terms. The second approach enables (1) evaluation in relative terms of how one facility stacks up against other similar facilities, and (2) the investigation of issues needed for policy decisions by equitable comparisons between the quality or type of service offered by programs that vary by particular factors. For example,

- 1. Does care in a day care home tend to offer more affection to children than care in a center?
- 2. Are programs related to large central organizations better able than independent facilities to deliver supportive services?

- 3. Do proprietary and nonprofit programs differ in terms of the nutrition they provide and in expressed attitudes towards parents?
- 4. Do caretakers who are particularly skilled in cognitive enrichment tend to address children in a group or as individuals?

To adjust for the differences in data generated by facilities exercising their options of choice, the following guides must be followed in dealing with the data in groups. For example, one would certainly not want to conclude that Center A was doing a fine job on nutrition in comparison to Center B if in actuality Center A scored the highest possible score on a Level I measure and Center B scored from an average to high score on scores using several more convincing levels of evidence.

The evaluation data should be scored, summarized, and manipulated on a goal-by-goal basis, maintaining separation between sources and levels of evidence. Do not combine or compare composite scores based on different sources or levels of evidence unless you can statistically control for the differences or unless it can be assured that all members of a data pool will have been subjected to the administration of identical procedures.

This Manual was designed for and pilot-tested in day care facilities primarily serving non-handicapped children from three through five years of age. Some special services that would be required for school-age, infant, or handicapped children have not been included. This Manual could be employed in the absence of evaluation tools for special programs (or in combination with specialized ones of limited scope). However, scores derived from the evaluation of special programs should not be combined or compared as equivalents with those derived from evaluation of the types of facilities for which the Manual was designed. (In analyzing and interpreting findings from special programs it should also be borne in mind that program features that appear to be lacking or weak or may have been replaced by specialized program features not evaluated by this Manual.)

To determine the need for or likelihood of special programs, observe the following: Determination of membership in a special group should be by entire program or by child groupings in the facility. If one-third or more of the groups in a facility qualify as special groups, then consider the data from forms concerning the operation of the entire facility as special.

If particular groups of children in the center qualify as special groups according to the following criteria, then consider the data from forms based on observation of group activities and environments as special.<sup>8</sup>

A group is special in terms of age if:

- 1. More than one-third of the children are under the age of three;
- 2. More than three children are under-the age of two years, six months;

8 Criteria in absolute numbers assume a group of fifteen or more. If the group's size is less, adjust number limits downward accordingly.

- 3. More than two children are under the age of two; or
- 4. More than two children are six years or older.

A group is special by handicaps if:

- 1. Any children are considered to have *serious* emotional, physical, hearing, or mental handicaps requiring specialized care;
- 2. More than one-third of the children are considered to have *mild* emotional, physical, hearing or mental handicaps requiring special consideration with or without auxiliary outside help;
- 3. More than one-third of the children are considered to have *serious* speech or perceptual handicaps; or
- 4. The group was organized to cluster handicapped children from within the facility.

Information to determine the eligibility of groups as nonspecial should be provided in Summary Sheets A and C.

The group data basis of handling the evaluation materials leaves great freedom for the evaluator or investigator, but it relies on strict adherence to the guides and restrictions given both while summarizing data from individual facilities and later while utilizing such data in comparative work.

Following are step-by-step directions on how to summarize and score an individual facility. They incorporate the restrictions and guides to maintaining the data in the proper categories for valid comparisons of group data.

To safeguard the legitimacy of findings based on this evaluation, both the directions and conditions for administering the forms and the directions for scoring and summarizing must be followed.

### Scoring for Indivdual Facility

The directions to follow cover the evaluation process in logical order for a single facility. The directions are specific and include summary sheets to be used in the scoring and summarization. The forms required for the completion of each job of summarization or scoring will be noted on the appropriate summary sheet along with the major purpose of that summary sheet. The headings of each summary sheet indicate the materials needed for completion. Wherever a summary sheet requires a mixture of available and unavailable materia's, complete as much as possible of the summary sheet with available materials unless otherwise instructed. The summary sheets are marked to indicate whether they are appropriate for the summarization of data from centers or day care homes, or both. The individual summary sheets contain specific directions and any tabulation or worksheets required for their completion.

Complete the summary sheets using the forms indicated.

### Identification:

To provide condensation of information that will facilitate identification, licensing supervision, and group data comparisons:

Summary Sheet		Forms
A (Centers)	·	1, 3, 6, 8, 10
B (Centers		6
C (Homes)	٠ -	18, 21, 24, 26
D (Homes)		21

### Objectives:

To establish (1) standards for evaluation by objective, and (2) channels for the feedback of on-site supervisory personnel:

Summary Sheet	Forms
E (Centers)	2
F (Centers)	2
G (Centers and Homes)	3 or 5
H (Centers)	3
I (Centers)	4
J (Homes)	19

### Evaluation of Administrative and Supporting Services and Staff Morale:

To summarize (1) the evaluation of attainment of selected administrative and supporting services objectives by evidence level and source, and (2) pinpointing likely sources of problems in staff morale:

Summary Sheet	•	Forms
K (Centers)		1, 6, 7, 17
L (Centers)		7
M (Homes)		18, 21, 22, 23, 27
N (Homes)	•	23

### **Evaluation of Direct Program Objectives:**

To summarize the evaluation of attainment of program objectives by source of evidence:

Suminary Sheet		Forms '	•
O (Centers')	*	8, 9, 11, 12, 13, 14,	15, 16
P (Homes)		11, 14, 15, 16, 24, 25	5

### Situations for Alert:

To pinpoint areas for investigation which *might* indicate serious problems, unrelated to the selected standards for evaluation:

Summary Sheet	Forms
Q (Centers)	17 and Summary Sheet 0.
•	Worksheets 0-1 and 0-4
·R (Homes)	11, 14, 24, 25, 27, and
•	Summary Sheet P,
•	Worksheets P-1 and P-?

### Using Evaluative Data

The summary sheets present the evaluation in the form most convenient for interpreting findings on a single facility and most convenient for use in a comparative evaluation or policy study. They are suggested as a first step in interpreting and inspecting the findings on the individual facility. It is further suggested that comparisons be drawn between (1) the opinions regarding objectives given by supervisory personnel at different levels and (2) priority ratings on program objectives with their actual outcome scores.

The process of summarizing selects data by its importance to the Manual objectives, and reduces information in mese selected areas. As in all summaries, information is not reflected that is vital to special in-depth purposes. It is therefore suggested that (especially in isolated evaluations of individual facilities and in attempts to set up comparative studies bearing on policy decisions) the summary sheets and the total of completed evaluation forms be utilized for points of departure for focused discussion and planning.

Summary (scoring) sheets are available upon request from the project agency in addition to packaged forms for multiple use. .

# FORM 2—Administrative and Supporting Services Objectives

**CENTERS** 

(Center completes form)

0		Address	
Center	<del></del>	Address	
Completed by		Date	

DIRECTIONS. Please read the directions before completing form. Complete each objective before going on to the next one.

Status as a Requirement: Under "Status as a Requirement," choose one of the following:

- Required by formal policy This objective is included in the contract, funding requirements, or formal policy statement (not open to alteration by an individual director) under which the center operates.
- 2. Not required by formal policy This objective is not required by the contract, funding agency, or formal policy statement under which the center operates.
- 3. More generally stated in policy This objective is a part of a more general statement of objectives given in the contract or formal policy.

Personal Opinion: Under "Personal Opinion," choose one of the following:

- 1. Felt to be important You personally feel that this is an important objective for day care centers in general.
- 2. Important, but in another type of center You personally feel that this objective, though important, is more suited to centers of a size, orientation, or affiliation different from your center's.
- 3. Felt not to be important You personally feel the objective is not an important one.

Status as Working Objective: Under "Status as Working Objective," choose one of the following:

- 1. Working objective This goal is a working objective of the cuiter. ("Working objective" refers to objectives whose actual ongoing accomplishment dictates staff activities. They are those things about which a director could say "Yes, we do work to accomplish this end.")
- 2. Done for special need or when accessible This objective is sought only in individual cases of very obvious need or when the opportunity for accomplishment is very readily available. The implication being that although the center has not undertaken an obligation to perform the service, it might be performed in special cases or in special circumstances of availability.
- 3. Not working objective This goal is not a working objective of the center.

Explanation of Responses in Parentheses: Under "Explanation of Responses in Parentheses" provide further explanation of each objective where choice is checked within parentheses.

- 1. Not top priority Because this objective is not as important as other things you have set about to do, it is not top priority at this time in your operation. (This choice could apply to directives included in contracts, which are being postponed at present in favor of more important ob jectives.)
- 2. Inadequate center staff Because center staff is currently inadequate in numbers or skills.
- 3. Inadequate staff participation
- 4. Inadequate funds or equipment
- 5. Inadequate space
- 6. Inadequate parent participation
- 7. Inadequate volunteer.help Because volunteer help is inadequate in qualifications, numbers, participation, or coordination.
- 8. Not appropriate to needs of center's children
- 9. Not appropriate to readiness of center's children
- 10. Inadequate coordination within center Because of inadequate coordination of skills, time, or resources within the center.
- 11. Inadequate coordination between center and helping agency Because of inadequate coordination between center and a supervising, funding, or helping agency.
- 12. Inadequate coordination or number of service resources in community

1

13. Function served by another objective — The basic function of this objective is considered to be served by a different but related objective.

1. OBJECTIVE: Use standard bookkeeping proc	edures.

## FORM 5—Program Objectives

(Central organization or supervising agency completes form)

## centers and HOMES

	,	1
Organization	Address	
Completed by	Date	
Completed by	Date	

DIRECTIONS. This form establishes objectives that can be used in evaluating the day care programs at the facilities supervised by your organization. Objectives should vary from program to program. The scoring of this form permits the programs of different facilities to be compared.

This form is based on the assumption that what is stated in formal policy, what an individual feels is most important, and what objectives are chosen as goals to actively work towards are not always identical. The reasons for these differences provide important information that will help to improve the delivery of day care service.

Choices are to be made between eighteen objectives. Each objective is compared to each of the others, making a total of 153 pairs. All the objectives represent positive or beneficial activities. Choose which of two objectives you feel is preferred by:

- 1. Formal Policy: Your understanding of the facility's contract, operating manual, or whatever is considered to be its official written source of supervision
- 2. Important: Your own feelings and understanding about what is important for the care of young children in day care.
- 3. Working Objective: The facility's working objectives in light of its actual situation (in practical terms regarding its setup, staff, and clients).

For each of the 153 pairs of objectives, there should be three indicators of preference (3 checks, one in each column). The exception is if your agency does not have formal written policies regarding the program in its day care facilities. In this case, do not complete the column about formal policy.

Make your decision about the importance of the objectives without particular groups or situations in mind. That judgment refers to day care in general. However, when choosing the preferred working objectives, do keep the particulars of the facility's individual situation in mind.

D.	Description of Center:
	Please check all items that accurately describe your center:
	1 Proprietary or operated for profit
	2 Not-for-profit
	3 Independent center (basically self directed and self-sustaining, hires its own staff, does not receive outside funding — except for possibly free or reduced-rate use of premises)
	4 Co-operative
`	5 Church related (having a relationship with a particular church or religious organization that goes beyond merely using their premises).
	6 Affiliated with a union (a union offering services to its own members and their children)
	7 Affiliated with a college or university. (If you occasionally allow students from a college to observe or practice in your center, then you are not affiliated but simply are doing the college a favor, but if your staff really trained and helped to evaluate students, then you are affiliated. Good criteria for affiliation versus doing favors might include whether the college gives financial support or provides substantial services and also whether there are any substantial supervisory connections between the college and center.) Check all statements that apply.
ī	<ul> <li>Providing training in child care and child development for students</li> <li>Providing services for the children of the school's students or employees</li> <li>Providing services for the surrounding community</li> </ul>
	8 Affiliated with a hospital. Check all statements that apply:
	<ul> <li>Providing training for staff or students</li> <li>Providing services for the children of the hospital's employees</li> <li>Providing services for the surrounding community</li> </ul>
	9 Affiliated with a company not primarily in business to provide day care or social services. Check all statements that apply:
	<ul> <li>Providing services for the children of the company's employees</li> <li>Providing services for the surrounding community</li> </ul>
	10 Member of a day care network (run under the auspices of a larger organization that supports other centers or provides other social services, the center is part of the larger organization and not related to it merely by contract). NOTE: If you checked #10, please complete Special Section 1.

	Associated center. (This cated loosely tied to another agency organization. The association is likely to be by contract or give their support to a conservice to a particular client authority over its own function ceiving substantial grants-in-dilarge private endowments.)  MOTE: If you checked #11,	of these centers with the others, of these centers with the others are for specific reasons, such a center if the center guaratele. The center or its organisms. ### SPECIAL SECTION XI

If you checked "yes" to #10 in Section G ("Service Procedures"), indicating that you regularly evaluate staff or volunteers, complete the following questions.

1. For each staff and volunteer position existing in your center indicate: (1) whether it is not evaluated, evaluated formally and recorded in writing, or evaluated informally without a record of the evaluation having taken place; and if evaluated (2) the frequency of the evaluation. Staff positions are listed first, followed by volunteer positions. Skip positions that do not exist in your center.

Dey Care Evaluation Menual
Council for Community Sc\*\*ices in Metropolitan Chicago

These forms are to be completed at all centers where physical facilities are evaluated:

\_\_\_\_\_Form 9 — Organization and Use of Indoor Space

\_\_\_\_\_Form 10 — Locale

\_\_\_\_Form 11 — Indoor Equipment, Supplies, and Activities Check List

Qne of these forms is to be completed:

\_\_\_\_\_Form 12 — Organization and Use of Outdoor Space — If the children play outdoors on the day of observation

\_\_\_\_\_Form 13 — Organization and Use of Gymnasium or Gross Motor Activity Area — If the children do not play outdoors on the day of observation, and if the indoor area used for gross motor activity is an area other than the one observed for Form 9.

To be completed only if Form 12 is completed:

\_\_\_\_\_Form 14 — Outdoor Equipment, Supplies, and Activities Check List

Place a check before all forms listed above that you will complete for this center. Form 10 should be

completed once per center. All other physical observation forms that are completed should be done

once for each group in the center observed.

ERIC

Full Text Provided by ERIC

Center	☐ A.M. ☐ P.M. ☐ P.M. ☐ Full Day
Observer _	
DIR: D rec	ECTIONS: Sections A, B, and C can be completed any time during the observation day. Section quires a full day of observing the adults and children using the indoor space. Items marked with sterisk (*) should be asked of the teacher.
Α.	Indoor Day Care Facilities: All Children
	How many rooms are occupied by the center? (include office space, kitchen, isolation room)
\$	a) How many of these rooms are directly used by the children?
2.	The decor of the rooms used by children is (estimate percentage of rooms):
	Bright, cheerful, attractive%
	Ordinary, not outstanding in any way%
- `	Dull and monotonous%
3	Are visible electrical outlets either protected or used with locked plugs? (If furniture is blocking outlets, consider how easily it could be moved by the children. If you cannot find any outlets, assume they are protected.) Estimate percentage of outlets protected:% protected
В.	General Description of the Room Occupied by Group Being Observed
	1. Can one adult see the whole room from any vantage point?
	¹ . □ Yes □ No
	2. Room shape (roughly):
	☐ Square ☐ Oblong ☐ Irregular
	3. Room size (estimate): ☐ Small ☐ Large ☐ Average ☐ Very large
·	4. Proportion of room covered by physical objects:
	☐ Almost all ☐ About 1/3 ☐ About 2/3 ☐ Very little ☐ About 1/2
•	5. What kind(s) of space are there for children's belongings in the center?
	☐ Drawer ☐ Folder ☐ Shelf ☐ Locker ☐ Box, ☐ Coat hook
	, a) Are these personal things labeled with a name or color?
· . ·	yes volume in the control of the co
•	6. Does the room reflect respect for the child, his possessions, products, and privacy in ways other than providing a place to store belongings? (For example, does a child have space for exhibiting his work; are frequently used articles such as chairs, cots, and towels marked with children's names; or, are one-child tables available.)

	activities on a day-to-day basis or for small segments of time, either by a child or an adult. It does not refer to items that are moved only seasonally.) Skip items that are not present in the room. Your answer does not have to total 100 percent.
	% of play equipment
	% of storage components
	% of partitions or room dividers (other than storage components)
,	8. Are shelves and equipment reasonably neat and well-organized (make allowances for when the children are using the equipment)?
	☐ Yes ☐ No
	9. Is the bathroom located close to the children's room? (Close means not having to walk past several rooms or down a long hallway or up or down stairs)
	□ Ƴes □ No
	10. Is the bathroom door too heavy or too difficult for some children to open?
	☐ Yes ☐ No ☐ No door
C.	Displays
	(Displays does not refer to unused play equipment hung or stored on walls or partitions.)
	1. Displays are taken from: (check all that apply)
ላ	<ul> <li>□ Children's efforts</li> <li>□ Staff and volunteer efforts</li> <li>□ Purchased art work, other than photographs</li> <li>□ Photographs (not clippings)</li> <li>□ Purchased posters</li> </ul>
	2. Displays as models for sex role behavior (check one):
	<ul> <li>□ Displays feature people in stereotyped sex roles (a woman performing household chores, a male doctor, a female nurse, a male policeman)</li> <li>□ Displays feature people in varied roles (a man taking care of children, a woman doctor a boy ironing a shirt)</li> <li>□ Not applicable</li> </ul>
	3. Displays as models for social behavior
	a) Group composition of displays (check one):
	<ul> <li>□ All displays feature one racial or ethnic group</li> <li>□ Displays feature different racial or ethnic groups, but individual displays picture members of one group</li> <li>□ Displays feature different racial or ethnic groups, integrated</li> <li>□ Not applicable</li> </ul>
	b) Authority figures (check one):  (An authority figure is a person recognized as being in an influential position, one who can give commands and take action: for example, a policeman helping children to cross the street, a dentist with patient, a teacher.)
	<ul> <li>☐ Minority group members are pictured as authority figures</li> <li>☐ Mot applicable</li> <li>☐ Minority and white authority figures are featured</li> </ul>

4. Topics of displays in rooms being observed testimate nationals.	
Models of letters and numbersTopics of general interest (pictures of children in school, scenic pictures of flowers or mountains)	
Topics of special interest to the group (zoo animals, if a trip has been planned)	
Health or nutritionParent and community participation in the center (honor roll for volunteer parents,	
photographs of center's opening)	
Personally meaningful to children (children's art work, photographs of center field trip	s)
Directional signs (north, south, † up; ↓ down)	
5. Is there a large clock?	
	_
a) If yes, are there some accompanying clock-reading aids such as clock's hands set for lunch ti	me
✓ □ Yes □ No	
6. Are there displays in the center's entry area featuring:	
Yes No	
'Children's work	
Parents' work or activities	
Announcements or reports of events at center	
Announcements or reports of community events	
7. Where are displays located? (Estimate percentage)	
% In rooms being observed.	
% In hallways	
% In entry area	
% In administrative area	
100% Total	
8. How high are displays hung? (Estimate percentage):	
% Child eye-level	
% Adult eye-level	
100% Total	
9. Is a current copy of the menu posted somewhere in the center?	
, □ Yes □,No	
NOTE: The following questions should be asked of the teacher:	
*10Do all children get their work displayed?	
□ Yes □ No	
*11. Who usually sets up the displays?	
☐ The teacher alone	
☐ The teacher dione ☐ The teachers and the children together ☐ The children alone	
,	

),	Arrangement of Activity Areas
	1. Does the room occupied by the group being observed have areas that are established for particular activities? (An established activity area is one where most of the necessary equipment is permanently set up for the children's use. Examples are: (1) a book shelf with a rug or table and chairs for reading space; (2) a housekeeping area with toy kitchen equipment and dolls; a truck holding the dolls, a stand-up mirror, and a toy stove arranged as partitions for the area; or (3) a letters and phonics area.)
	☐ Yes ☐ No <sup>2</sup> If no, skip to #2 under this heading. If yes, answer the following questions:
	· a) Check which established activity areas are present:
	□ Audio-visual equipment □ Dolls □ Wheel toys □ Housekeeping area □ Musical instruments □ Play house (child-sized structure) □ Woodworking □ Dress-up □ Clay □ Science □ Painting □ Books □ Other art work □ Letters and phonics games □ Equipment for large-muscle activities
	b) Does the area arrangement permit (check if yes): (Consider the number of children arrange can accommodate at one time)
	☐ Individual activity ☐ Small group activity ☐ Large group activity
	c) Are boundaries defined by (check all that apply):
_	☐ Play equipment ☐ Storage components ☐ Partitions ☐ Displays ☐ Walls ☐ Surrounding empty space
	d) Are children permitted or encouraged to use established area equipment elsewhere in the room(s)?
	☐ Yes ☐ No
	2. Are there flexible activity areas? (A <i>flexible</i> activity area is one defined by the teacher, such as by regrouping or setting out equipment for an activity, or by directing and limiting children's activity to a specific area. Examples are setting out Tinkertoys to be used at one table, tumbling mats on empty floor space, and clay on another table; or telling children who start playing with small wheel toys that they can play only in one spot.)
	☐ Yes ☐ No If no, skip, to #3 under this heading. If yes, answer the following questions:
	a) Does the area arrangement permit (check if yes):
,	☐ Individual activity ☐ Small-group activity ☐ Large-group activity
	b) Are children permitted or encouraged to use flexible area equipment elsewhere in the room(s)?
	□Yes □No

DIRECTIONS: This		e completed in	n final form	at the end o	f the observation	day. Notes may

A. Equipment and Supplies Checklist

Each piece of equipment is to be scored, if it is clearly present, according to its safety, accessibility, adequacy in numbers, workability, and whether used today. Do not request that storage cabinets be opened for your inspection. Score the equipment and supplies that are part of the apparent environment.

General guidelines for these scores are as follows:

1. Safety: Metal equipment should have no sharp edges, be free of rust, and not bend or give under hard use. No apparatus should be too high for an adult to pluck a child off its top, and it should be constructed in such a way that a jumping or falling child will have a good chance of avoiding impact with the apparatus. Wood objects should be splinter-free, and of close-grained wood. Plastic should be heavy-duty and unlikely to splinter. Pointed objects should not be in a permanently fixed position likely to stab a falling or passing child. Equipment should be stable, well balanced, so it will not tip over with an uneven distribution of weight.

All substances used on equipment or by children should be nontoxic. You probably will not be able to determine the toxicity of paints used originally on equipment or in its repair, but excessive peeling of paint should downgrade your judgement of safety. For the most part, the toxicity of products designed for children can be determined. Nontoxic paints, clay-like materials, and crayons are almost always labeled "nontoxic" on their container. If this type of item is not kept in its original container and if you cannot manage to unobtrusively inspect the original containers in a storage area, you may assume they are safe if they are major brands of products made for children. Detergents and other such substances are generally labeled with safety precautions if they are toxic. Safety is to be rated on a scale of three:

- 1 Safe
- 2 Questionable safety
- 3 Apparently unsafe
- 2. Accessibility: The access a child has to the equipment provided for the group being observed or when the child is in the general vicinity of the equipment. If equipment is not used on the day of observation, then it should not be scored for accessibility. (An exception is equipment stored high above children's reach, which may be scored as very limited or inaccessible.)

If some equipment is kept in a room where the children are not allowed to enter, then denying access to the equipment, if a child were to enter that room, is most likely meant to guide a child out of an unsupervised area. Equipment in that area should not be scored at all unless it is at one time or another during the observation day brought into a child-use area, or the children are brought into the room where it is located.

An accessibility rating should not be affected by inaccessibility caused by the fact that one child is using the piece of equipment at the time when another child wants to use it. When the group is engaged in a special activity and a child is not permitted to leave the activity and use some other equipment unrelated to the activity, do not count the equipment as inaccessible. Accessibility is to be rated on a three-point scale:

- 1-Completely accessible: Something a child can approach and use without permission from the caretaker or help in getting it out.
- 2-Limited accessibility: Permission or help is needed, but is almost always granted.
- 3-More limited accessibility: Permission or help is needed, and is withheld frequently.

(If "3." indicate if it is because:)

- a-Being able to use the equipment is considered a special reward
- b—The equipment is used for special times or activities
- 3. Adequacy in Number: An adequate amount of equipment according to demand. It is all right for children to have to wait to use the equipment. Do not count instances where the caretaker limits the amount of equipment that children can use at one time (for example, passing out only a few pieces of Tinkertoys to each child.) These cases should be rated under accessibility. Adequacy in number is to be rated on a two-point scale:

1 – Adequate2 – Inadequate

- .4. Workability: Do all pieces of equipment really work the way they look like they should and are al the required parts present? Workability is to be rated on a three-point scale:
  - 1-Completely unworkable: The equipment cannot be used at all either because an important piece is missing or because other equipment necessary for its use is not available (for example, paints, but no brushes).
  - 2-Partially unworkable: Unworkable in some minor way or relatively unimportant parts missing; the equipment can still be used safely by the children but not to its full extent or in ways that require improvisation on the children's part (for example, toy telephone with dial broken, a set of nesting cups with a few sizes missing).
  - 3-Workable: No parts are missing or broken; other equipment necessary for its use is available.
  - 5. Used today: Was the equipment`used today by children in the group being observed? Used today is rated on a two-point scale.

1 - Yes

2 - No

In completing the following form, place the number of your rating for each category next to each piece of equipment that is clearly present in the room being observed.

7. If any of the types of equipment listed below is present, designate if it is permanent or movable. Movable refers to program activities on a day-to-day basis or for small segments of time, either by a child or an adult. It does not refer to items that are moved only seasonally. Permanent Movable Balance beams Bench Climbing barrels Hopscotch boards Jungle gym Large building blocks Low climbing apparatus Merry-go-round Monkey bars Rocking toys Sand box Seesaw Slides Spring horses Swings (small or large) Tires Trike path Tub 8. Overall, how would you rate the design of this area? (Consider the following: Do the shape of the space and the distribution of objects allow ease of movement throughout the area, adequate empty spaces, clear paths, easy supervision without excessive walking, efficient placement of storage units so that materials are stored close to their point of use, potential for long-term variety, and capacity for reorganization? Are there multiple-use units?) ☐ Very good ☐ Poor ☐ Good ☐ Very poor ☐ Fair Comments, if any:

## **Equipment and Supplies Checklist**

Each piece of equipment is to be scored, if it is clearly present, according to its safety, accessibility, adequacy in numbers, workability, and whether used today. Do not request that storage cabinets be opened for your inspection. Score the equipment and supplies that are part of the apparent environment.

General guidelines for these scores are as follows:

1. Safety: Metal equipment should have no sharp edges, be free of rust, and not bend or give under hard use. No apparatus should be too high for an adult to pluck a child off its top, and it should be constructed in such a way that a jumping or falling child will have a good chance of avoiding impact with the apparatus. Wood objects should be splinter-free, and of close-grained wood. Plastic should be heavy duty and unlikely to splinter. Pointed objects should not be in a permanently fixed position likely to stab a falling or passing child. Equipment should be stable, well balanced, so it will not tip over with an uneven distribution of weight.

All substances used on equipment or by children should be nontoxic. You probably will not be able to determine the toxicity of paints used originally on equipment or in its repair, but excessive peeling of paint should downgrade your judgement of safety. For the most part, the toxicity of products designed for children can be determined. Nontoxic paints, clay-like materials, and crayons are almost always labeled "nontoxic" on their container. If this type of item is not kept in its original container and if you cannot manage to unobtrusively inspect the original containers in a storage area, you may assume they are safe if they are major brands of products made for children. Detergents and other such substances are generally labeled with safety precautions if they are toxic. Safety is to be rated on a scale of three:

- 1 Safe
- 2 Questionable safety
- 3 Apparently unsafe
- 2. Accessibility: The access a child has to the equipment, provided for the group being observed or when the child is in the general vicinity of the equipment. If equipment is not used on the day of observation, then it should not be scored for accessibility. (An exception is equipment stored high above children's reach, which may be scored as very limited or inaccessible.)

If some equipment is kept in a room where the children are not allowed to enter, then denying access to the equipment, if a child were to enter that room, is most likely meant to guide a child out of an unsupervised area. Equipment in that area should not be scored at all unless it is at one time or another during the observation day brought into a child-use area, or the children are brought into the room where it is located.

Day Caré Evaluation Manual Council for Community Services in Metropolitan Chicago

An accessibility rating should not be affected by inaccessibility caused by the fact that one child is using the piece of equipment at the time when another child wants to use it. When the group is engaged in a special activity and a child is not permitted to leave the activity and use some other equipment unrelated to the activity, do not count the equipment as inaccessible. Accessibility is to be rated on a three-point scale:

- 1-Completely accessible: Something a child can approach and use without permission from the caretaker or help in getting it out.
  - 2-Limited accessibility: Permission or help is needed, but is almost always granted.
  - 3-More limited accessibility: Permission or help is needed, and is withheld frequently.

(If "3," indicate if it is because:)

- a-Being able to use the equipment is considered a special reward
- b-The equipment is used for special times or activities & .
- 3. Adequacy in Number: An adequate amount of equipment according to demand. It is all right for children to have to wait to use the equipment. Do not count instances where the caretaker limits the amount of equipment that children can use at one time (for example, passing out only a few pieces of Tinkertoys to each child.) These cases should be rated under accessibility. Adequacy in number is to be rated on a two-point scale:
  - 1 Adequate
  - 2 Inadequate -
- 4. Workability: Do all pieces of equipment really work the way they look like they should and are all the required parts present? Workability is to be rated on a three-point scale:
  - 1—Completely unworkable: The equipment cannot be used at all either because an important piece is missing or because other equipment necessary for its use is not available (for example, paints, but no brushes).
  - 2—Partially unworkable: Unworkable in some minor way or relatively unimportant parts missing; the equipment can still be used safely by the children but not to its full extent or in ways that require improvisation on the children's part (for example, toy telephone with dial broken, a set of nesting cups with a few sizes missing).
  - 3-Workable: No parts are missing or broken; other equipment necessary for its use is available.
- 5. Used today: Was the equipment used today by children in the group being observed? Used today is rated on a two-point scale.

1 - Yes

2 - No

In completing the following form, place the number of your rating for each category next to each piece of equipment that is clearly present in the room being observed.

14-2

# B. Activities Checklist

For each of the activities listed below, indicate which ones:

- a) The children tried to start
- b) The children did engage in
- c) Were successful, as far as children's involvement and interest seem to indicate

Check as many columns as are applicable for each activity.

# FORM 15—Observation of Group Experiences

# CENTERS and HOMES

DIRECTIONS. Forms 15 and 16 on program observation are the most important instruments in the manual, for they measure the program characteristics and the caretaker interaction with the children more directly than any of the other forms.\* These forms are also the most difficult to complete with accuracy since they require many subtle judgments on the part of the rater.

The forms consist of several rating scales, each one measuring one particular dimension or facet of program or caretaker behavior. The definitions and examples listed under the scale headings provide the information on which judgments of degree are to be based. The scales guide the observer in describing and making distinctions of degree about the program or caretaker behavior.

The observation period needed to complete these forms is long and intensive, and the forms will be completed after you leave the facility. The observation should be conducted in two ways: (1) a two-and-one-half hour observation period should be set aside specifically for these forms. During this time, however, you should be aware of the occurrence of events that are evaluated by other forms. (2) While you are present at the facility and observing for and completing other forms, you will observe behavior that can and should influence your ratings of Forms 15 and 16.

The best time to do the intensive observing for Forms 15 and 16 is when the program is in full swing (including free choice periods, if the program offers them). For the facilities in the field tests, this time was usually in the morning, after the completion of arrival activities. You should not do any intensive observing for these forms during routines such as nap time when the children are asleep, at lunch time, or when the children are waiting to go home. Nor should you do any when the group is outdoors — unless a large portion of the day is spent outdoors and the area is confined enough so that you can hear what is being said. As in all observing, remain as distant as possible to avoid affecting the behavior of caretakers and children.

While observing for the two-and-one-half hour period, you should take concentrated process notes for use in completing the forms later. If the flow of the program seems to demand it, the period of concentrated note-taking may be distributed within the same day to equal the time required. Note-taking keeps one incident from being too heavily weighed in judgment when the forms are filled out, and prevents the observational orientation of the observer from waning during an extended period of time.

Only one copy of Form 15, Observation of Group Experiences, should be completed for the group under observation. An exception to this rule exists where children are shifted to a different program in the middle of the day. For example, some nursery schools with adjunctive day care facilities include the day care children in the nursery school program for one-half of the day and provide different staff or room space for the other half. In this case, observe in the nursery class for a half-day and in the day care class for the rest of the day. Complete a separate Form 15 for each part of the program.

Form 16, Program Observation of Individual Caretakers, should be completed for each caretaker who is with the group when any of the children are awake. Do not observe other persons who are simply observing the group for any purpose. Complete this form for the five or fewer caretakers who have supervised the children for the longest period of time over a half-hour. An exception is where children are shifted to a different program in the middle of the day. In this event, as many as five copies of Form 16 for each of both parts of the program day may be completed.

<sup>\*</sup>The term "caretaker" includes teachers, assistant teachers, aides, volunteers, directors acting as teachers, day care mothers, assistants to day care mothers, and older children who help care for or watch younger children.

The note-taking pages should be divided into as many columns as there are caretakers to be observed at any one time. All notes on a particular caretaker, including the times of her arrivals and departures, are made in one column. In this way, separate copies of Form 16 can be completed by the end of the day. Notes taken on a caretaker who was present for less than a half-hour can simply be crossed out at the end of the day, and no form completed for that person. If there are more than five caretakers per group (or per half-day in the case of a program shift), then disregard the notes taken on the extra caretakers who were on the scene for the shortest-periods of time.

Notes should be taken for short recall, because the forms should be completed as soon as possible after leaving the facility. They should be filled out based on your overall impressions, not just by counting up your notes. The notes serve as reminders, and your reasoning for the ratings does not have to be written in the notes. The notes should be able to justify your impressions, but only with you as the interpreter. They need not be legible or comprehensible to others without your help. You must be thoroughly familiar with the scales so you will know what to look for. This requires an intensive study of the forms before any observing is attempted. It will be helpful to discuss the scales and what they mean with other observers.

You may notice that remarks and behaviors referring to or addressed to individ all children have more impact on your sensibilities than those addressed to the group. They probably have a disproportionate effect on children as well, so you may allow this difference to affect your judgmen. However, do be aware of and consider more than just the most prominent or noteworthy caretaker behavior when completing the forms. Your ratings should reflect your impressions as gained throughout the day, a great deal of which should be gathered from observations of the more common or less spectacular aspects of caretaker behavior.

Do not leave any scales blank unless you saw absolutely no evidence one way or the other of the behavior described by the scale. The fact that more than one type of scale appears in these forms should not be a source of disturbance to you.

You are strongly encouraged not to avoid choosing the extreme points of a scale just because you once saw a similar behavior that was more extreme, or because you expect eventually to observe something more extreme. The more observers are able to score toward extremes, the more likely it is that the manual can discriminate between facilities according to the types of care they provide. It is very unlikely that a caretaker will strike a child, or that she will produce a startlingly creative way of responding to a situation. Do not wait for these kinds of behavior to score toward the extremes of a scale.

In making your judgments on the scales in Form 15 you may sense that your best judgment does not reflect the actual inconsistency observed regarding the topic under consideration. When this is the case, make an I in front of your scoring mark to indicate that though you have scored the best summary of what you have observed, there is an inconsistency (which probably affects children) in the group's environment:

A list of abbreviated headings is attached for use in taking notes for Forms 15 and 16. This list corresponds to the headings of each rating scale in Forms 15 and 16. The scales are numbered consecutively, starting with scale 1 in Form 15 and ending with scale 73 in Form 16.

15-2 00265

# ABBREVIATED HEADINGS FOR USE IN TAKING NOTES (for Forms 15 and 16)

#### Form 15

Gro	Name of facility:	•
	Group name, if more than one group at facility (room number, name of head teacher):	1
	□ A.M. □ P.	
	Date of observation:	· ·
	Time observer was with group:A.M. toP.M. Time of nap:P.M	
Ohs	server Identification:	1
ODS	Name of observer:	· · · · · · · · · · · · · · · · · · ·
	Time on site:A.M. toP.M.	•
v		to
	Time during which concentrated notes taken (should total two-and-a-half hours):	to
		to
		Totalhou
1.	Proportion of Time Spent by Typical Child in Various Aspects of the Program  Estimate by percentage of entire day. Base your answer on what you observe today.	•
	•	
	<ul> <li>% 1 — Free play, indoors</li> <li>% 2 — Free play, outdoors, in gym, or area set aside for gross motor activities</li> </ul>	•
	% 3 — Routines (taking off and putting on outer clothing, group time devoted and putting away materials, washing, toileting, snack, lunch, and rest)	to picking up
	% 4 — Caretaker-directed (initiated and structured) group play activities indoornhythms, games, listening to music, singing)	rs (story-reading,
	% 5 — Caretaker-directed games or exercises outdoors, in gym, or gross motor	
	% 6 — Formal lessons (the children are expected to acquire a specific skill and strate whether they have learned. Examples: Spanish lesson, Bible stu- count)	perhaps demon- dy, learning to
•	% 7 — Excursions (a walk, go to the store)	^
2.	Number of Children	
	Number of children in the observed group for most of the day:	•
3.	Number of Caretakers	
	Number of caretakers taking primary responsibility for the group being observed	

#### 4. Number of Actively Involved Caretakers

Average number of caretakers actively involved with children in this group at any one time. Use decimals if you feel it will make your estimate more accurate. If children had only one caretaker and they were at any time beyond her earshot, then this answer should be less than one. If in this case she could at least hear them, then this answer can be "1." \_\_\_\_\_\_

#### 5. Authority Relationship Among Caretakers

This scale is concerned with obvious lines of authority and responsibility among the caretakers in the facility. An apparently authoritarian relationship exists in the following examples: The teacher is heard to give orders to aides without explanation; aides are not allowed to take responsibility but must wait for the teacher to tell them what to do, or are relegated to clean-up jobs almost exclusively; the manner in which the teacher talks with aides and her tone of voice might indicate a somewhat contemptuous attitude that she enjoys bossing people around.

An apparently democratic relationship exists in the following examples: The teacher makes suggestions to the volunteer or asks her to do something; she explains; she listens to suggestions from volunteer; volunteer takes some responsibility for the group, or parts of the group, or for particular group activities; teacher's manner and tone of voice indicate respect for the volunteer.

This scale refers to two dimensions: attitudes and assignments of jobs. Let the attitudes you sense influence your choice somewhat more than the job assignments. Attitudes are more discernible by children, and it is natural for more skilled persons to take over more critical assignments. Since you are to make one judgment relating to the multiple relationships in the facility, make sure that your judgment is affected by the whole network of relationships and its general impact on the atmosphere. Try to imagine if a child could perceive a hierarchy among the staff or if he could tell who was the "low man on the totem pole." (Do not include older children acting as caretakers in your consideration of this scale.)

- 1 Quite authoritarian
- ·2 —
- 3 --
- 4 —
- 5 —
- 6 Quite democratic

#### 6. Affective Relationships Among Caretakers

Caretakers amusing themselves together should not affect scoring toward the extreme. Friendly relations in the facility between caretakers who take some time away from children should not be scored lower in comparison.

Try to infer people's real feelings for each other, not just surface amenities. Try to discern how comfortable the caretakers appear to be with each other. Include older children acting as caretakers in your judgment, but do not include momentary conflict between a child acting as caretaker and an adult caretaker who is that child's parent.

- 1 Positive relationship (Relationships seem amicable and friendly; no signs of friction, tension, conflict, or temperamental incompatibility among caretakers.)
- , 2 <del>-</del>
  - 3 Few signs of friendliness. Some caretakers may have little or no contact with certain other caretakers, perhaps by their own design or they may pass up opportunities to be friendly and only discuss what is necessary for the conduct of business.
  - 4 Slight, but some unmistakable signs of dislike, tension, or conflict among caretakers
  - 5 Some genuine dislike, conflict, friction, or temperamental incompatibility in evidence among caretakers

15.5

#### 7. Caretakers' Attitudes Toward Parents

How do the caretakers treat parents who bring or pick up children, or who drop by. Try to discern if any parents are treated rudely.

- 1 In a respectful or friendly manner
- 2 Generally in a neutral manner
- 3 In a manner that may be interpreted by an observing child as unfriendly or disrespectful

## 8. Caretakers' Attitudes Toward Nongroup Members

How do caretakers treat outsiders in the group (a visiting director, an observer), especially those who seem to be in a superior position.

- 1 In a respectful or friendly manner
- 2 Generally in a neutral manner
- 3 In a manner that may be interpreted by an observing child as unfriendly or disrespectful

## 9. How Much Are Social and Play Contacts Between Children Encouraged

When rating, consider not only the frequency of occurrence but also the amount of time, elaboration, and thoughtfulness involved in each instance. Two examples are:

Unelaborated Example: Caretaker suggest to David, who is pulling a wagon, that he gave Emma a ride.

Elaborated Example: Same as above. If the children agree to this, caretaker might stay near them and make other suggestions, such as that Emma and David might get some blocks to put in the wagon, or that some other wheeled toy might be attached to the wagon.

Implied in this emphasis of social contacts is the notion that they are enjoyable for children or that necessary social skills are learned through social contacts. Mere proximity need not to be construed as encouragement to social contact. Several children not encouraged to interact and working at the same table may be there only for convenience. However, setting up a snack table with only two places is some inducement to social contact because just two people are more likely to really interact than a group.

Playing organized games that do not pair people up or promote contact in some other way, and "you children go and play together" should be rated "low." Some real facilitation by the caretakers (either in planning or guidance) is necessary for a higher score. Naturally you are to coalesce your impression of the whole day in your judgment.

- 1 Very high
- 2 High
- 3 Moderate
- 4 Low
- 5 None

# 10. How Much Are the Requirements of Group Living Emphasized

"Requirements of group living" include sharing, taking turns, listening to others, cooperation, respect for property belonging to others, etc. When rating, consider not only the frequency of occurrence but also the amount of time and elaboration involved in each. Two examples are:

Unelaborated: If Johnny is trying to grab a wagon from Lucy, caretaker says to Johnny, "You'll have the next turn with the wagon."

Elaborated: Caretaker says, "You'll have a turn with the wagon as soon as Lucy is through. Everybody who wants to can have a turn, but we only have one wagon. Maybe you could let Lucy pull you in the wagon for a while, and then you could have a turn pulling her." Caretaker may also sing

15.6

a song about each child pulling the wagon, or each child having a turn, etc.

- 1 Very high
- 2 High
- 3 Moderate
- 4 Low
- 5 None

# 11. Are the Rights of the Individual in Group Living Respected and Acknowledged

For example, the right to be left alone or the right to privacy, the right to complete a project without interference, the right to decline a turn or to not answer, or the right to have one's legitimate feelings validated. This scale is *not* intended as a contrast to the previous one. A caretaker who simply ignores the children is not respecting these rights; there must be a more active acknowledgment to convey the impression sought here.

- 1 Very high
- 2 High
- 3 Moderate
- 4 Low
- 5 None

## 12. Rules for Putting Away Equipment for Individuals and Small Groups

What does the prevailing policy seem to be in regar to putting toys and equipment away when used by children individually or in very small groups.

- 1 Each thing must be put away by child before getting another thing to use.
- 2 Things must be put away before a new activity is started. (The essential difference between this point and the previous one is that materials or equipment can be combined here if the child so wishes. That is, he does not have to store equipment before he takes another type of thing provided he is using them together.)
- 3 Things do not have to be replaced until particular turning points in the day, provided there is ample room. (A turning point is a major shift in activities initiated by the caretakers and most likely affects the whole group, such as a change from outdoor free play to an indoor caretaker-directed activity. The difference between this point and point 2 is that in 2 the decision to start a new activity is made by the child, such as moving from block building to finger painting during a free play period. The fact that turning points in the day may interrupt the use of equipment when one of the two previous scoring categories is more appropriate should not be reflected in the present category.)
- 4 Equipment and toys need not be put away until the end of the day.
- 5 No requirements about putting things away.

# 13. Determining Individual and Small-Group Users of Equipment

Do the caretakers generally make an attempt to determine which child or which children should be responsible for putting this "individually used" equipment away.

Υ	es	N	Ю

### 4. Rules for Putting Away Equipment for Group Activities

In regard to equipment and materials used in group activities:

- 1 Things must be put away before a new activity is started.
- 2 Things do not have to be replaced until a particular turning point in the day, provided there is ample room

- 3 Equipment and toys need not be put away until the end of the day.
- 4 No requirements about putting things away.

## 15. Who Cleans Up After Group Activities or When User of Equipment Is Unknown

Which of the following seems to be most characteristic (in regard to materials used in groups or those used by unknown individuals):

- 1 Children put away, most everything
- 2 Children put things away with the help of caretakers
- 3 Caretakers and children share the responsibility
- 4 Caretakers clean up while children are otherwise occupied
- 5 Caretakers clean up while the children wait or look on

### 16. How Scheduled the Day Was

Were there many times when activities were clearly scheduled and appeared to be similarly scheduled on other days. The activities themselves need not be structured ones; free play may be a scheduled period. What is sought here is a sense of whether the children seem to know what to expect in general throughout the day. Lunch, naps, putting on and taking off of outer clothes are expected to be predictable by children and should not influence your judgment. If children progress to a new activity with minimal cues you could assume the change is expected by them.

- 1 No obvious scheduling outside of routine activities
- 2 –
- 3 -
- 4 Clearly scheduled, anticipated, and acknowledged by children's behavior

#### 17. Number of Major Scheduled Periods

How many major scheduled periods or turning points did there appear to be in the day (exclusive of routines). Acknowledgment and anticipation by children of the periods does not play a major part here as it did in the previous scale. The fluctuation of scheduled activity is the essence of what is sought here.

- . بر
- 3 . 8
- 4 \_\_ 9
- 5 10 or more

#### 18. Amount of Shifting of Activities Within a Scheduled Period

How much changing of activities within these major schedule slots did there seem to be. This scale focuses on the frequency of change and how long children spend on an activity. Do not base your ratings on how smoothly the transitions are made.

- 1 A great deal (children go rapidly from one activity to another when they have the option: for example, from puzzles to clay, or from painting one picture to painting another, or the caretakers redirect the group often during group activities.)
- 2 -
- 3 -
- 4 -
- 5 Very little (children seem to address single activities for extended periods. Group activities follow on the same theme for extended periods.)

# 19. Extent of Children's Involvement

To what extent do children in this program seem intensely involved in what they are doing. NOTE: A child wandering around who seems to be really observing what others are doing or really trying to decide what would be most interesting to do is *not* a sign of noninvolvement, especially if the child settles on something to do.

- 1 Very involved (children are often deeply absorbed in what they are doing.)
- 2 –
- 3 –
- 5 Very little involvement (Example: Often there is a sense of purposelessness, perfunctory performance—merely going through the motions—or perhaps aimless wandering.)
- 20. Relaxation or Tension of the Children
  - 1 Very relaxed (children seem unpressured, unrushed, adequately paced)
  - 2 Generally relaxed
  - 3 Moderately relaxed
  - 4- Generally tense
  - 5 Very tense (children seem upset; there is frequent wild and excited behavior; a great deal of friction; relaxed periods are rare.)
- 21. Distracting Socializing Among Caretakers and Self-Amusement

During the time when caretakers were actively on duty within earshot of children, how much socializing among caretakers or self-amusement took place that could be interpreted as diminishing the attention given to children. For day care mothers, activities such as involved phone calls, or watching television while children did something else would count. For center staff, prolonged conversations on duty would count. Taking care of the facilities does not count, provided communication is possible with children at the same time.

- 1. Very little distracting socialization or self-amusement
- 2 -
- 3 -
- 4 A great deal of distracting socialization or self-amusement
- 22. How Much Are Specific Program Aspects Used to Encourage and Stimulate Children's Cognitive Development

Cognitive development means such skills as: language development; understanding of concepts; development of ability to differentiate, generalize, and abstract; understanding of physical and other relationships; and understanding of the immediate environment (home and school) and as much of the large environment as is age appropriate. (All learning experiences related to basic operations count for this scale. Learning how to button, sort flatware, learning that there is a left and a right shoe are relevant here.) To what extent were learning activities stimulated during each of the following activities (skip activities that did not occur):

- a. Free play activities
  - 1 A great deal
  - 2 A noticeable amount
  - 3 Somewhat....
  - 4 Very little observed

- b. Caretaker-directed activities (for the whole group or subgroups)
  - 1 A great deal
  - 2 A noticeable amount
  - 3 Somewhat
  - 4 Very little observed
- c. Routines and transitions
  - 1 A great deal
  - 2 A noticeable amount
  - 3 Somewhat
  - 4 Very little observed
- d. Formal lessons
  - 1 A great deal
  - · 2 A noticeable amount
    - 3 Somewhat
    - 4 Very little observed
- e. Excursions
  - 1 A great deal
  - 2 A noticeable amount
  - 3 Somewhat
  - 4 Very little observed
- 23. Estimate the Variety of Cognitive Skills Stimulated Throughout Program Day

This scale refers to the range of types of cognitive skills the caretakers are able to weave into the program

- 1 A great deal
- 2 A noticeable amount
- 3 Somewhat
- 4 Very little observed

# · 24.3 Learning Potential Program

How rich is this program in learning potential. Please bear in mind that it is fairly easy to attempt to teach letters and phonics recognition, counting skills, and naming things compared to less obvious preschool skills. Attend to the potential for learning these less obvious preschool skills. Generally these skills include the understanding of concepts; development of ability to differentiate, generalize, and abstract; understanding of physical and other relationships; understanding the working of the immediate environment and as much of the larger environment as is age-appropriate; problem-solving.

- 1 A great deal of learning potential built into program features
- 2 -
- .3 --
- 4 --
- 5 -
- 6 A poverty of learning potential
- 25. Types of Learning Skills Emphasized

Estimate the percentage of the learning activities geared to obvious verbal skills (letters, counting, naming things) and those aimed at the less obvious preschool skills (as explained in the previous scale). Your answer does not have to total 100 percent.

# FORM 16—Observation of Individual Caretakers

# CENTERS and HOMES

•	
DIR	ECTIONS: See instructions for completing Form 15, Observation of Group Experiences.
Nam	e of facility:
	p name, it more than one group at facility (room number, name of head teacher):
~_~	P.M. □ Full day
Nam	e of observer:
į	Caretaker Identification:  Name (first name or other firm identification will do, or whatever the children call her. It is best not to ask people their namé if it will make them uneasy):
3,	
<u>,</u> î ,	
	Approximate age (in years):
	Time observed on duty to ; to ; to ; to ; to
31.	Specialized Contact by Type of Program Setting  Was this caretaker's contact with children limited to certain activities, if so, what was she most involved in. Do not mark what she was best at, but only to show what she was limited to.
	1 — Free play, indoors
	2 — Free play, outdoors, in gym, or area set aside for gross motor activities
	3 - Routines
	4 Caretaker-directed group play activities indoors
	5 - Caretaker-directed games or exercises outdoors, in gym, or gross motor activities area
	6 - Formal lessons "
	7 — Excursions
32.	Caretaker's Typical Posture What best typified this caretaker's posture in talking to an individual child at close range:
	1 — Usually ascumes a standing position 2 — Does not change posture in order to address a child 3 — Stooped, crouched, sitting, or on knees, etc.
<b>33.</b>	Clinical Comments on Child  Did this caretaker speak to another person about a child within earshot in a derogatory manner. Do not include here comments addressed directly to the child being talked about; that possibility is covered separately. Examples from the pilot test are: A teacher called out to another teacher: "Watch out for Betty because she wets her pants." "John has a perceptual handicap; he is not as

slow as he appears." "Tim can never get his shoes on the right foot." Such comments may be true facts, but they are spoken without regard to the child's feelings. That is, the child is probably

aware that he is being put down.

- . 1 None
  - 2 At least once
  - 3 -
- 4 A noticeable amount

#### 34. Clinical Comments on Family

Did this caretaker speak about a child's family in a clinical or derogatory manner within earshot of the child. For example: "Mary's mother never dresses her warm!y enough; I always have to lend her a sweater."

- 1 None
- 2 At least once
- 3 -
- 4 A noticeable amount of this behavior

#### 35. Typical Voice Tone and Volume

Regardless of the range, what was characteristic of the caretaker's voice:

- 1 Noticeably soft and gentle, never raised voice appreciably
- 2 Mostly normal conversational; sometimes soft or somewhat increased volume for special purpose; never close to yelling
- 3 Normal conversational or somewhat soft; sometimes near shrill or sharp for special purposes
- 4 Often volume louder than conversational; but never shrill or yelling quality
- 5 Often volume louder than conversational; sometimes shrill or yelling quality
- 6 A noticeable amount of yelling or shrill quality to her vocalizations

#### 36. Caretaker's Manners in Dealing with Children

- 1 Noticeably polite
- 2 –
- 3 Sometimes rude

#### 37. Caretaker's Emphasis on Manners and Decorous Behavior for Children

Manners: verbal politeness "Thank you," "Please," "Excuse me"); table manners (use of proper utensils); not running or shouting unless part of an activity, etc.

- 1 Very high
- 2 High
- 3 Moderate
- 4 Low
- 5 None

#### 38. Caretaker As a Role Model for Language Usage

This scale refers to correct pronunciation, word meaning, grammar, etc. (Do not rate caretakers whose native language is other than English.)

- 1 Good
- 2 Fair
- 3 Poor

16-2

- 39. Caretaker's Dependence on Expressions of Appreciation or Affection From the Children An observer will sense that some caretakers are performing for the children and are dependent on their adulation. Instead of being able to evaluate their influence on the child by using their knowledge of and sensitivity to the child, some caretakers seem to require the child's validation or approval. This is a difficult aspect of behavior to describe, but you are like to recognize it when you see it.
  - 1 Very great dependence
  - 2 Great dependence
  - 3 Moderate dependence
  - 4 Slight or little dependence
  - 5 No dependence

#### 40. Restrictions and Demands

How many restrictions and demands does this caretaker make that are not motivated (as far as you can tell) by safety, the continuation of the program, or the special needs of a child. Try to rate this scale by how imposed upon the children might feel because of these restrictions and demands. That is, if a restriction or demand seems to make sense to the child, and does not irritate or interrupt him, then its demanding or restricting quality converts more to guidance or reminders. "Come to lunch," unless a child is not allowed to put the finishing touch to his activity, is not very limiting. Let the restrictiveness or apparent severity of the caretaker's comments influence your judgment as well as the frequency of such instances.

- 1 Rarely imposes restrictions and demands
- 2 Imposes few restrictions and demands
- 3 Imposes a moderate number of restrictions and demands
- 4 Imposes numerous restrictions and demands

#### 41. Explanation of Restrictions

To the extent that restrictions, on-the-spot decisions, or unusual pieces of behavior on the part of the caretaker are thought to impinge on the children, how much does the caretaker explain the reason for her action. (Examples of decisions or unusual behaviors are a particular resolution in settling a fight, appointing a helper for jobs not already assigned, stopping a game before each child has had a turn, losing her temper, etc.)

- 1 Always explains reasons
- 2 Usually explains reasons
- 3 Sometimes explains reasons
- 4 Seldom explains reasons
- 5 Never explains reasons

# 42. Mode of Reinforcing Restrictions or Demands

Given a situation in which a child noticeably resists complying with a restriction or demand, which of the following seems characteristic of the caretaker's approach. (Rank the caretaker's methods, beginning with "1" for what was most characteristic. Skip methods that were not used at all by this caretaker.)

 Physically moving or restraining the child, parts of his body, or whatever equipment he is involved with. (The severity of the force used is not at issue here, but rather the fact that a physical means of gaining compliance is used. A case where the caretaker gently holds a child's face toward her own so that the child must pay attention counts here. Force and punitiveness will be covered in a separate scale.)				
 Reasoning with the child	•	,		
 Arguing with the child		s		

scale continued on next page

Repetitive verbal insistence (akin to nagging)

 Changing the subject or diverting the child	
 Capitulation, or surrendering the point	

43. Caretaker's Response to Consequences versus Intent of a Child's Act, Mishaps, or Disruptive Incidents Does the caretaker focus more on the intent or on the consequences of a child's act, particularly when the act is disruptive. Examples: A child knocks over the block construction of another child accidentally. A caretaker who emphasizes intent would point out the accidential nature of the incident or the surrounding physical setup that made passage without mishap very difficult. A caretaker who emphasizes consequences would comment on the distruction of the block construction or how terrible the builder must feel. (Note, however, if she talks about the feelings of the builder primarily to the builder, then this should not enter your judgment here.)

A child is trying to pour himself a glass of milk, which is put out for children to help themselves, to; he spills the milk, missing the glass. The caretaker takes the pitcher, pours the milk for him, and sees that the milk is wiped up. In doing so she is only minimally acknowledging intent of the child, but is emphasizing the consequences. If she takes the pitcher and does not pour the milk (or makes the child ask for it) she is emphasizing consequences. If she allows or encourages the child to pour again, with or without help, she is emphasizing intent.

During story time a child giggles, and the caretaker says "I know I didn't pay much attention to you today, but don't do that because I can't continue with the story." In this instance, she focused on the consequences and the intent about equally.

If the intent attributed to a child is malicious or in some way meant to point out a weakness of the child ("John won't come down the slide because he is afraid." "Susie pushed because she is mean") the incident is not scorable under this scale.

- 1 Almost always focuses on intent
- 2 Focuses on intent more than on the act or its consequences
- 3-/Focuses on act or consequences and intent about equally
- 4 -/ Focuses on the act or consequences more often than the intent
- 5 + Almost always focuses on the act itself or its consequences

#### 44. Punitiveness of Control

To what extent are tactics for control or reinforcement of children characterized by psychological punitive measures. Examples of punitive behavior include sarcasm, shaming, abusive criticism, humiliation, prolonged or relatively severe isolation, and ridicule. Examples: The children's group activity involves jumping three times in unison. One child jumps too many times. The teacher points this out, "Johnny can't count to three." A statement such as "David, if you don't want to do what the rest of us are doing you may go sit on that chair and do something else," is eligible for affecting this scale depending on the tone of voice the caretaker employs and to whom she addresses her remarks. If she talked in a sharp tone to the child and addressed him with the other children watching the encounter, then she was at the least humiliating him and perhaps isolating him severely. If she addressed him without an audience and seemed to intend to offer the child an alternative activity, then her behavior does not qualify as negative psychological control or reinforcement.

If a caretaker publicly identifies a feeling she thinks is motivating the child's behavior in order to guide or control his behavior, and if this feeling is one that a child would prefer not to have identified in front of his peers, then the caretaker's behavior is to be considered negative psychological control and reinforcement. Examples: "John is afraid to come down the slide." (Had this caretaker simply tried to acknowledge what she assumed the child's feelings were, for example, "It seems scary to look down a slide, doesn't it? Come slide down," then her comments would not have to be considered negative psychological control and reinforcement.) In this scale the child is addressed directly, whereas on the previous clinical remarks scales 33 and 34, the child is within earshot of remarks about him directed to another person.

- 1 Control methods always nonpunitive
- 2 Control methods usually nonpunitive
- 3 Control methods occasionally nonpunitive
- 4 Control methods occasionally punitive
- 5 Control methods usually punitive
- 6 Control methods almost always punitive

#### 45. Amount of Observing by Caretaker

To what extent does this caretaker assume an observational stance. Does this caretaker observe the children in her charge often and carefully. For example, does she seem to step back and carefully watch what they are doing. Does she tend to assume a position in the room that is a good vantage point. Does she look up and scan the group from time to time when she is working with an individual child. This scale asks if the caretaker does any observing, not how perceptively she observes or if she learns anything from it.

- 1 Very observant
- 2 Observant
- 3 Somewhat observant
- 4 Not observant
- 46. Manner of Resolving Conflicts or Incidents that were not Observed in Their Development

  Given a caretaker attending to a situation that calls for resolution (a broken piece of work or a conflict between children), indicate the types of resolutions you observed to be characteristic. Did she consistently try to find out what had happened:

Yes.	 
No_	

Provided she could not determine what happened, which of the following were characteristic? (Circle all that most clearly apply):

- 1 Blamed (or held responsible) one of the children because of her expectations of his behavior rather than because of what she saw
- 2 Punished both children
- 3 Acted in a way that implied both children were responsible
- 4 Separated the conflicting children
- 5 Isolated the conflicting children
- ♣6 Distracted the children
- 7 Negotiated a settlement
- '8 Ignored the situation beyond inquiring about the cause

#### 47. Acknowledgment of Feelings versus Standards of Behavior

To what extent does the caretaker acknowledge the child's feelings versus a standard of behavior in dealing with the children. A standard of behavior is a prescribed manner of acting in certain circumstances, such as verbal expressions of politeness.

Example: A child is fighting. Caretaker: "Are you angry because..." versus "Say you are sorry" or "It looks scary from up on the slide..." versus "Take your turn and come down the slide." If a caretaker insists on a certain behavior, such as saying "I'm sorry," and you feel the caretaker is trying at least in part to give the child a feeling of having been absolved of guilt, then the remark should count more for acknowledging feelings rather than standards of behavior. In comparison with scale 43, which emphasized intent versus consequences, a major difference here is whether the caretaker addresses the child whose feelings she is talking about or the child who is held responsible for having caused the feelings. "You made Jimmy sad by knocking down his blocks" accentuates consequences

16-5

versus intent, and does not emphasize acknowledging feelings unless she in some way addresses Jimmy. Depending on what else the caretaker says, the same incident might bear on the scoring of scales dealing with the rules of group living and respect for individual rights in group living (10 and 11).

- 1 Almost always acknowledges feelings
- 2 Acknowledges feelings more than standards of behavior
- 3 Acknowledges feelings and standards of behavior about equally
- 4 Acknowledges standards of behavior more often than feelings
- 5 Almost always acknowledges standards of behavior
- 48. Caretaker's Direction of Attention or Remarks to the Whole Group versus Individual Children (A group for these purposes is three or more children for a center and two or more for a home)
  - 1 Predominantly to the group (caretaker spends most of her time and energy on overseeing and managing the group with little attention to the activities of individual children)
  - , 2 More to the group
  - 3 More to the individual
  - 4 Predominantly to the individual (caretaker spends most of her time working with individuals and small groups, and gives little attention to overall managerial role)
- 49. Caretaker's Response to the Children as Individuals
  - 1 Very high (Caretaker's manner of address and response to the children is highly differentiated. For example, she tends to talk to the children individually, her voice and manner vary when dealing with different children, there are indications that she knows a great deal about the personalities of the children and their likes and dislikes. She knows what kinds of activities the individuals like to engage in, and what particular things they have been doing. She also shows a knowledge of "where the particular children are at" in learning a skill or working with a particular piece of equipment.)
  - 2 High
  - 3 Moderate
  - 4 Low
  - 5 Very low
- 50. Balance of Approval and Disapproval-Expressed by Caretaker

All expressions of approval or disapproval are included, for example, of children's behavior, products, effort, clothing, verbal expression, etc.

- 1 Expressions of approval predominate; little or no disapproval expressed
- 2 More frequent expressions of approval than of disapproval
- 3 Expression of approval and disapproval about equal
- 4 More frequent expressions of disapproval than of approval
- 5 Expressions of disapproval predominate; little or no approval expressed
- 51. Caretaker's Differential Response to the Children

Caretaker's special treatment of groups of children — two or more — having characteristics in common. Groups refers to discernible types, such as shy children. Differential treatment can be favorable or unfavorable. Examples are: Caretaker pays a great deal of attention or very little; expresses a great deal of affection or none; gives much praise or much criticism; gives special privileges or none; is highly involved, identified with, or is not at all involved, or identified with. Note the contrast between this scale and scale 49, which dealt with responding to children as individuals.

- 1 Very great
- 2 Great
- 3 Moderate

cale continued on next page

- 4 Little 5 - None
- 52. Apparent Basis for Differential Response to Children

A differential response has to have been observed with two or more children. Place a plus in front of categories receiving preferential treatment and minus in front of categories treated unfavorably. Skip this scale if no differential response was observed.

- 1 Sex
  - a Boys
  - b Girls
- 2 Racial, ethnic background
- 3 Behavioral deviance
  - a Excessively shy, withdrawn, passive children
  - b Excessively aggressive, assertive children
  - c Excessively dependent children
- 4 Intellectual ability
  - a High
  - b Low
- 5 Other (specify)

### 53. Physical Punitiveness

Is this caretaker physically punitive. Does she hurt children, shake them, use more force than necessary in restraining them. Does she insist that they assume uncomfortable physical positions.

- 5 Quite punitive physically
- 4 Somewhat
- 2 Slightly
- 1 Not at all physically punitive
- 54. Relaxation of Tension: Caretaker
  - 1 Very relaxed (caretaker seems unpressured, unrushed; there is very little friction between caretaker and child)
  - 2 Generally relaxed
  - 3 Moderately relaxed
  - 4 Generally tense
  - 5 Very tense (caretaker seems pressured and pressuring most of the time; there is a great deal of friction between caretaker and child)

## 55. Amount of Overt Affection Expressed by Caretaker

Does the caretaker seem fond of the children. This scale refers not only to physical and verbal expressions of affection, but also to facial and other, less explicit expressions.

- 1 Numerous expressions of affection
- 2 –
- 3 –
- 4- None

### 56. Consistency and Steadiness: Impulsive or Stable

1 — Caretaker tends to behave in an impulsive erratic manner (she is sometimes affectionate toward children, sometimes cold and unloving; unable to control her anger at times, at other times she is well controlled; she is subject to obvious mood swings. She contradicts her

scale continued on next page

directions without apparent good cause. Sometimes she is very permissive and other times autocratic.)

2 —

3 -

4 —

5 —

6 — Caretaker tends to behave in a stable manner (her behavior regarding affection for the children is even; she shows consistency of mood; she has an even temper. Seems to always carry through on plans unless there is good cause not to. She is consistent in her expectations and demands.)

57. Creative Introduction of Cognitive Skills

Estimate the amount of creativity, resourcefulness, and good judgment shown by the caretaker in weaving cognitive skills into the program aspects in which she was involved. In this scale *creativity* means being able to slip in cognitive skills as opportunities present themselves. The activity engaged in or the particular cognitive skill taught does not have to be unusual. For example, cookies baking in the oven are a chemical process, and the caretaker could point out that a change is taking place when the cookies are baking. Or a child who is cleaning up puts too many crayons of one color into the same box, and the caretaker shows the child how to figure out what is wrong. (Note: do not lower the caretaker's score if the program or the equipment is so well planned that her on-the-spot resourcefulness has less opportunity to be called into play.)

1 — A great deal

2 - A noticeable amount

3 — Somewhat

4 - Very little observed

58. Caretaker's Display of Curiosity About the World

Example: Curious, exploratory: Caretaker expresses curiosity, both verbally and nonverbally, about the world (why things are as they are, about relationships, causes, motivations, physical change, etc.); indicates that asking questions is important and interesting; that it is possible, through exploration, to find answers to questions; that she herself does not know all the answers, that no one does. Her behavior implies the world is wonderful and open to exploration.

Incurious: Caretaker does not express curiosity about the world; does not explore the environment or ask questions to which she may know the answers; her behavior therefore may imply that she knows all the answers, or that it is not worth the effort to be inquisitive.

1 - Very high curiosity

2 - High curiosity

3 – Moderate

4 - Low curiosity

5 - Incurious

# 59. Caretaker's Encouragement of Children's Curiosity, Exploration

- 1 Very high encouragement (Example: responsive to children's questions. Although she may sometimes answer them directly, her tendency is to help them to find the answers by asking questions herself, by encouraging them to think for themselves, by providing or suggesting materials, activities, or experiences that may lead to further explorations.)
- 2 High encouragement

3 - Little encouragement

4 - No encouragement (caretaker ignores children's questions or tells them she is too busy to answer questions. When they make spontaneous remarks that do not fit in with her plans or preconceived ideas, she may ignore them or tell them to keep quiet.)

# 60. Caretaker's Attention to the Children's Communications Whether Verbal or Nonverbal

- 1 Always attends to children's communications, regardless of content. Caretaker indicates, verbally or nonverbally, that the values what the child is communicating or trying to communicate. If unable to attend at the moment, caretaker indicates to the child that she will get back to him, and does so. During group discussion or lessons, caretaker indicates to any child who wishes to speak that he will have a turn and sees that he does.)
- 2: Attends more frequently than not to children's communications. (Nonverbal communications may be ignored more often than verbal; unassertive children more than assertive ones, or vice versa. Caretaker is not as likely to promise or carry through on promises to get back to a child if she is unable to attend at the moment, either in individual or group situations.)
- 3 Some attention to children's communications.
- 4 More frequently than not ignores children's attempts to communicate. (Caretaker's attention is selective: she may attend to specific kinds of communications, or to particular children's, or may be attentive only in certain situations, such as formal lessons or "show and tell.")
- 5 Generally ignores or actively discourages children's attempts to communicate. (Caretaker tells children to be quiet when they try to communicate or will attend only to the most urgent communications, such as when a child is hurt or wants to go to the bathroom. She may ignore them because she is unaware when children are trying to communicate.)
- Emphasis on Experiential Mode for Encouraging and Stimulating Children's Cognitive Development Experiental: emphasis on sensory motor experiences as a source of learning; provision of relevant experiences, materials, activities through which to broaden children's understanding of the physical world, etc.

Do not confuse experiential behavior with talking about experiences the group has had together, such as going to the zoo. Experiential behavior relates to learning by doing or having actual (and usually immediate) sensory or muscular feedback on the effect of the child's behavior (for example, encouraging a child to feel the weight of two substances, or to pour milk to discover and self-correct his own knowledge of the operations involved). Doing activities that are very common to the child and from which he is not discovering or confirming are not to count toward experiential orientation. When rating, take into account the amount of time and elaboration involved in each incident.

- 1 Very high
- 2 High
- 3 Moderate
- 4 Low
- 5 None
- 62. Caretaker's Role Regarding Children's Choices of Individual Activities Consider all activities observed throughout the day.
  - 1 -- Always gives children complete freedom to choose materials and activities; makes no suggestions even to children who seem unable to choose.
  - 2 Generally gives children free choice, but occasionally will make a suggestion or start a child on an activity if he seems unable to do his own.
  - 3-
  - 4 Morè often than not, caretaker determines children's activities by suggestion, getting matérial, and giving it to child, etc.
  - 5 Children have little opportunity to choose own activity. Caretaker nearly always determines actual activity for children by suggestion, getting material, and giving it to child, etc.

## 63. Caretaker's Direction of Children's Play Activities

This scale refers to the degree to which the caretaker tells children what to paint, build, draw, etc., or how to do it, verbally or by example. It does not refer to choice of activity. It does not apply to formal lessons, but rather to all child-initiated play and to appropriate caretaker-directed activities. This scale refers mainly to activities the child has just started, rather than those already in progress.

When rating, consider not only frequency of occurrence but also the number of children involved each time.

- 1 Very high
- 2 High
- 3 Moderate
- 4 Low
- 5 None
- 64. Caretaker's Encouragement or Stimulation of Children's Self-Expression.

Encouragement: may include active interest in and attention to what a child is saying or intermittent nods, gestures, sounds, or verbal response.

Stimulation: includes asking a child to clarify what he is saying, making responses that require further elaboration by the child, direct questions as "Can you tell me what your painting is about?", asking a child to tell a story, asking children to talk about personal experiences and how they felt when they had these experiences, asking a child to describe his feelings when frustrated, upset, angry, enjoying himself; asking children to describe sensory experience in words, for example, how different textured fabrics feel. Also to encourage child to indicate by gesture as well as words.

When rating, consider not only the frequency of occurrence but also the amount of time and elaboration involved in each. Remember the orientation here is self-expression rather than problem-solving.

- 1 Very high
- 2 High
- 3 Moderate
- 4 Low
- 5 None
- 65. Convergent reasoning (attempting to deduce or discover the one best solution to a problem. For example, "What color is this?") Have you witnessed this caretaker guiding the children in this type of reasoning.
  - 1 Caretaker definitely encouraged this orientation
  - 2 Slight encouragement
  - 3 No encouragement; passed up good opportunities for encouragement without this or other orientations being encouraged.
- 66. Divergent reasoning (attempt to inductively expand the possible answers. For example, what kind of uses can you think of for a brick for a doorstop, for building, as a bookend.) Have you witnessed this caretaker guiding the children in this type of reasoning.
  - 1 Caretaker definitely encouraged this orientation
  - 2 Slight encouragement
  - 3 No encouragement; passed up good opportunities for encouragement without this or other orientations being encouraged

- 67. Broadening base of knowledge ("What does a rooster say? Does he make different sounds when he sees the sun in the morning and when he is looking for food?") Have you witnessed this caretaker guiding the children in this type-of reasoning.
  - 1 Caretaker definitely encouraged this orientation
  - 2 Slight encouragement
  - 3 No encouragement; passed up good opportunities for encouragement without this or other orientations being encouraged
- 68. Broadening associational approach ("There is a moving van, what do you think ... new people are moving nearby, ... I wonder if they have children your age ... I wonder if they have boys or girls.") Have you witnessed this caretaker guiding the children in this type of reasoning.
  - 1 Caretaker definitely encouraged this orientation
  - 2 Slight encouragement
  - 3 No encouragement; passed up good opportunities for encouragement without this or other orientations being encouraged
- 69. Caretaker's Interest in the Working-Playing Process versus Quality of the Final Product Working-playing process: Children's involvement in, active use of, and expression through various creative media, such as blocks, paints, clay and crayons. This is a very difficult interest to engender in adults and a difficult one for them to demonstrate to children. (For example, "Oh . . . how did you make that clay snake; did you roll it, or spin it in your hand?")

Quality: Representativeness, prettiness, neatness, etc. Note: "That is very interesting; what is it" is to be considered a "4" as it is so common and oriented to product. "That's interesting; how did you do it" is a "3" since it is too stock a phrase to be scored "1" or "2".

- 1 Caretaker is more interested in, values more, the working playing process than the quality of the final product.
- 3 Caretaker is interested both in the working-playing process and the quality of the final product.
- 4′-5-
- 6 Caretaker is more interested in, values more, the quality of the final product than the effort and involvement that went into it. (Caretaker tends to express approval of products that meet conventional standards and disapproval of those that do not, such as "That doesn't look like a flower" or "That's a very pretty picture.")
- 70. Caretaker's Interest in Children's Thinking versus Correct Answers

  Thinking: Children's reasoning, evaluation, and judgments about the physical world and about people and social relationships. Which of the following characterizes the caretaker's approach:
  - 1 Caretaker is more interested in children's thinking process than in their giving correct answers. (Caretaker tends to show interest in children's explanations and to accept or approve evidence of their thinking even if the conclusion is incorrect. Caretaker tends to ask relevant questions:

    Jane "I'm older\_than Tommy." Caretaker "Why do you say that?" Jane "Because I'm bigger.")
  - 2 Caretaker is interested both in the thinking process and in correct answers. (Caretaker asks relevant questions, encourages verbalization or demonstration of thinking process, gives approval to children's thinking. If child's conclusion is based on inadequate information, she may supply the necessary information and help him arrive at the correct conclusion.)

scale continued on next page

5	*	3.— Caretaker appears to be more interested in correct answers than in the thinking process.  (Caretaker tends to pay little or no attention when whild attempts to explain his ideas; she makes little or no attempt to encourage children to verbalize or demonstrate their reasoning. She gives approval only to "correct" answers or to what she considers the proper answer and expresses disapproval of incorrect answers: Jane — "I'm older than Tommy." Caretaker — "No, you're not. He's five and you're four.")
71.	Cori Give	rections of Errors by Caretaker en that the caretaker attempts to correct an error made by the child, which is characteristic:
		1 — Caretaker attempts to relate child's response to a reasonable process (or is somehow very gentle, in negative feedback).
;	v	2 — 3 — 4 —
•	·	5 — Caretaker seems slightly harsh or thoughtless in providing negative feedback or ignoring response where child seems to expect one.
72.	If y whi Om	s in Problem-Solving ou have observed the caretaker aiding or guiding a child in any problem-solving type of activity, ich seems characteristic of her approach. Rank in order (with the most characteristic as "1"). it those not observed. Problem-solving activities scorable in this scale can take place during routines, play, and caretaker-directed activities.
;		Waits until child has gone as far as he can and then gives clues that are integral to the problem and requires solution by the child so that essentially the whole problem is solved by the child and his interchange with the problem material. (Child is stymied working on puzzle of a skunk sitting on a stump. Caretaker: "What is this [the stump]?" From there the child concludes that the puzzle piece should be placed at the bottom. Or the caretaker draws the child's attention to edges with reverse shaping, etc.)
		Waits until child needs help; then gives clue extraneous to object of the problem ("This piece goes on the b" The child is to deduce "bottom.")  Waits until the child needs help and then shows or tells him the next step needed for
		solution.
		Waits until the child needs help and then takes over and completes the problem.
٠,	/	Does not wait until the child needs help to give assistance.
13.	Wh not wh	direction of Activity len a child is using a piece of equipment or materials in an unusual way or in a way the items were to designed to be used, and he seems to be enjoying the activity (when this activity is not destructive), at seems to be characteristic of the caretaker. Rank in order (with the most characteristic as "1"); it those not observed.
•	,	Joins in the child's new method or otherwise approves
*		Watches without interfering .
		Redirects with extreme subtlety (the caretaker could begin to do a similar activity hear the child so he might observe her method; or, she might say nothing until the next/time he approaches the material)
•		Redirects in relatively matter-of-fact manner
	, <b>.</b>	Redirects in a way that would suggest clear disapproval of the child's method
	• 6	16-12 00287

	Cleaning vegetables Assisting its tasks such as mixing, beating, spreading
	Assisting its tasks such as mixing, beauting, spreading Counting napkins
	Cleaning up
	Other (specify)
r)	Do children brush their teeth at the center?
	· □ Yes □ No
7. Naj	o Time
့ a) ِ	Do all children lie down? ☐ Yes ☐ No
b)	How are children handled who can't or won't fall asleep?
	(1) By observation:
	(2) Number of observations:
	*(3): By teacher inquiry:
c)	How long is nap time?
d)	Do napping arrangements appear comfortable? Describe type of cot, permanence of its location nap time sounds, and lighting.
8. İlle	ness
*a)	Are children who appear to be ill allowed to stay in the center during the day?
•	☐ Yes ☐ No ☐ Not observed
*b)	If yes, where do they stay?
*c)	Does the center attempt to contact parents or anyone else regarding the illness?
C)	
	☐ Yes ☐ No ☐ Not observed

	<i>b</i>
	nis center shifts children to a different program in the middle of the day, how are the children is sferred from the morning room to the afternoon room?
 ). Dep	parture Activities
a)	Approximate time span over which most full-time children are departing:
*b)	Inquire of the teacher sometime during the day to complete the following:
	Approximate number of children departing:
	With parent or adult relative
	With older sibling or neighbor child
	School bus
	Other (specify)
c)	Estimate the percentage of children from the group you are observing whose departure is supervised in the following ways:
	% By a professional staff member (teacher, assistant teacher, etc.) who works mainly with the child's group
	% By a professional staff member who does not work mainly with the child's group
	% By a nonprofessional staff member (clerk, aide, volunteer, etc.) working mainly with the child's group
	% By a nonprofessional staff member who does not work mainly with the child's group
*d)	If you are observing in a center that has more than one defined group, note, based on teacher inquiry, whether staff working with different groups rotate the assignment of bidding farewell:
	☐ Yes ☐ No ☐ Not applicable
	·Comments if necessary for clarity:
·e)	Estimate percentage of children who are bade farewell by name (or with evidence of specific
- •	acquaintance) by a staff member:%

	g)	Are children who leave on the bus supervised as they leave?
		☐ Yes ☐ No
	h).	Are children who do not leave in buses held ready and dressed in a group at a central point at outer door for pickup,
*		or do the people who pick them up call for them in their room or another place where they are occupied until called for $\Box$ .
	i)	Are the children ready to go when someone comes for them?
		☐ Yes ☐ No
11	out	out how much time did the children spend waiting for activities or routines to take place through- t the day? (For example, waiting in line to wash hands before lunch, waiting for food to be served iting to go home. <i>Waiting</i> implies that the children are not allowed to engage in play activity or
		eract with each other to any great extent.)

Snacks -					•

# Instructions to Day Care Mother

The same activities are listed below. For each activity please indicate whether:

- 1) You encourage it
- 2) You think it is a good idea, but you do not encourage it at present because of lack of time or equipment, or because the children are not ready for it
- 3) It is usually done by the children without close supervision
- 4) It is done when closely supervised by an adult
- 5) It is usually suggested or started by the children when it occurs
- 6) It is usually suggested or started by you or an adult helper when it occurs
- 7) The day care children often do it together with your own young children
- 8) It is often shared with and supervised by your older children.

Dey Care Evaluation Manual Council for Community Services in Metropolitan Chicago

### B. Records:

1. Indicate if any of the following records are kept by the individual day care mothers, by the agency, or both. No notation will signify that records are not kept on that topic. If the agency keeps records on a topic, give their specific location and the name of the person responsible for maintaining them.

	• , , ,	Kept by Day Care Mothers	Kept by Agency	Location of Records in Agency	Custodian

# D. Services

Describe what role, if any, your agency plays in each area of operation listed on the following pages. Do so by indicating whether:

(1) Your agency gives consultation and advice to the day care mothers so that they can perform the service more effectively; (2) your agency actually provides the service; or (3) your agency arranges for some outside source to provide the service. Where the third alternative is checked, please give the name of the provider, state if you know the specific procedures followed, and if you monitor them. You may check as many alternatives as are appropriate for each area. No notation will signify that your agency is not involved with that particular area of operation.

#### SPECIAL SECTION I Child Recruitment

If you indicated in Section D that your agency provides this service, complete the following questions.

A.	Are	your e	day care ho	mes enrolle	d to <sup>s</sup> an exter	ις satisfactory	for efficient use of staff and	spacé?
					λ			
`	V		☐ Yes	□ No		•		,

- B. If you have used (directly or indirectly) any of the child recruitment procedures listed below, specify for each procedure used:
  - 1. By circling the appropriate number, rank how much the procedure has been used, where 1 signifies most often used and 5 least often;
  - 2. Whether the procedure has been effective; and
  - 3. Whether this procedure is used only under special conditions where more clients are needed or when the opportunity to use it is readily available.

DIRECTIONS: Unless you are selecting forms to complete for special purposes of your own, select the physical situations to be observed as follows:

These forms are to be completed at all homes:

\_\_\_\_\_Form 25 - Use of Indoor Space

\_\_\_\_\_Form 26 - Locale

\_\_\_\_\_Form 11 - Indoor Equipment, Supplies, and Activities Check List

To be completed only if the weather on the day of evaluation is conducive to outdoor observation and the children play outdoors:

\_\_\_\_\_Form 14 - Outdoor Equipment, Supplies, and Activities Check List

Place a check before all forms listed above that you will complete for this home.

Home	Address
Observer,	Date
). A.	Indoor Facilities:
	1. How many rooms are in the day care home? (Do not count bathrooms):
	a) Are the day care children allowed to use all of the rooms?   Yes   No
	b) If no, how many rooms do they use?
	2. Composition of floors used by children:
	Good Condition Bad Condition
	Rough wood
	Smooth wood
	Tile
	Linoleum
	Concrete
. `	Carpeting or large rugs
	3. The decor of the rooms used by the day care children is (estimate percentage of rooms):
	Bright, cheerful, attractive%
	Ordinary, not outstanding in any way%
	Dull and monotonous%
	4. Are visible electrical outlets either protected or used with locked plugs? (If furniture is blocking outlets, consider how easily it could be moved by the children. If you cannot find any outlets, assume they are protected.) Estimate percentage of outlets protected%
1	5. Kinds of built-in facilities in day care home (use one slash (/) if present, and an (X) if present out access is cut off from children):
1	Stairway
<b>3</b>	Elevator
	Operating fireplaces
